

Product Description

Sirenza Microdevices' SGA-8343 is a high performance Silicon Germanium Heterostructure Bipolar Transistor (SiGe HBT) designed for operation from DC to 6 GHz. The SGA-8343 is optimized for 3V operation but can be biased at 2V for low-voltage battery operated systems. The device provides high gain, low NF, and excellent linearity at a low cost. It can be operated at very low bias currents in applications where high linearity is not required.

The matte tin finish on Sirenza's lead-free package utilizes a post annealing process to mitigate tin whisker formation and is RoHS compliant per EU Directive 2002/95. This package is also manufactured with green molding compounds that contain no antimony trioxide nor halogenated fire retardants.

[1] 100% tested - Insertion gain tested using a 50 ohm contact board (no matching circuitry) during final production test.

[2] Sample tested - Samples pulled from each wafer/package lot. Sample test specifications are based on statistical data from sample test measurements. The test fixture is an engineering application circuit board (parts are pressed down on the circuit board). The application circuit represents a trade-off between the optimal noise match and input return loss.

Junction Temperature Calculation

MTTF is inversely proportional to the device junction temperature. For junction temperature and MTTF considerations the device operating conditions should also satisfy the following expression:

$$P_{DC} < (T_J - T_L) / R_{TH}$$

where:

$$P_{DC} = I_{CE} \cdot V_{CE} \text{ (W)}$$

T_J = Junction Temperature (C)

T_L = Lead Temperature (pin 2) (C)

R_{TH} = Thermal Resistance (C/W)

Biasing Details

The SGA-8343 should be biased through a dropping resistor or with active bias circuitry to prevent thermal runaway and combat Beta variation. For passive biasing it is recommended that the voltage drop be at least 20% of V_{CE} . A voltage divider from collector-to-base is preferred over a simple series resistor. The effect of Beta variation can be minimized by bleeding $\sim 10 \cdot I_B$ through the shunt resistor.

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Collector Current	I_{CE}	72	mA
Base Current	I_B	1	mA
Collector - Emitter Voltage	V_{CE}	5	V
Collector - Base Voltage	V_{CB}	12	V

Operation of this device beyond any one of these limits may cause permanent damage. For reliable continuous operation, the device voltage and current must not exceed the maximum operating values specified in the table on page 1.
