

80mΩ, 1A Power Multiplexer

General Description

The RT9705A is a dual input single output power multiplexer specifically designed to provide seamless voltage transition between two independent power suppliers. Equipped with two low $R_{DS(ON)}$ N-Channel MOSFETs driven by internal charge pump circuitry, the RT9705A is able to deliver 1A output current with only 80mV voltage drop. Manual or auto switching mode is easily selected by two digital inputs D1 and D0. When both D0 and D1 are selected high, the RT9705A enters shutdown mode and consumes minimum power making it ideal suitable for battery powered equipments. A STAT pin with open drain output is provided to indicate the switch status. A user-programmable up to 1.25A current limit function is available for maximum safety in various applications.

The RT9705A provides comprehensive protection functions, including adjustable current limit, over temperature protection, soft start function for minimum inrush current, cross-conduction protection, and reverse conduction protection. These features greatly simplify power multiplexer design. The RT9705A is available in TSSOP-8 package requiring minimum board area and smallest components.

Ordering Information

RT9705A □□

Package Type
C : TSSOP-8

Operating Temperature Range
P : Pb Free with Commercial Standard

Note :

RichTek Pb-free products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.
- ▶ 100% matte tin (Sn) plating.

Features

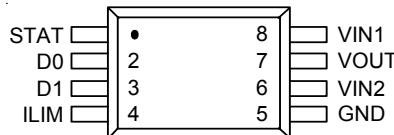

- Adjustable Current Limiting up to 1.25A
- Built-In (Typically 80mΩ) N-Channel MOSFET
- Reverse Current Flow Blocking (no body diode) i.e. Output Can Be Forced Higher than Input (Off-State)
- Low Supply Current :
 - ▶ 55µA Typical at Switch on State
 - ▶ Less than 0.5µA Typical at Switch Off State
- Guaranteed 1A Continuous Load Current
- Wide Input Voltage Ranges : 2.8V to 5.5V
- Open-Drain STAT Output
- Hot Plug-In Application (Soft-Start)
- Thermal Shutdown Protection
- Smallest TSSOP-8 Package Minimizes Board Space
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- LCD Monitor, LCD-TV
- Information Appliance and Set-Top Box
- Battery-Powered Equipment
- ACPI Power Distribution
- Motherboard & Notebook PCs
- Mini PCI & PCI-Express Cards
- PCMCIA & New Cards

Typical Application Circuit

Functional Pin Description

| Pin Name | Pin Function |
|----------|---|
| VIN1 | Power Input1 Voltage |
| VIN2 | Power Input2 Voltage |
| VOUT | Output Voltage |
| GND | Ground |
| STAT | STAT is an open-drain output that is Hi-Z if the VIN2 switch is ON. |
| D0, D1 | The truth table shown below illustrates the functionality of D0 and D1. |
| ILIM | A resistor R_{ILIM} from ILIM to GND sets the current limit I_{LIM} to $(500/R_{ILIM})$. |

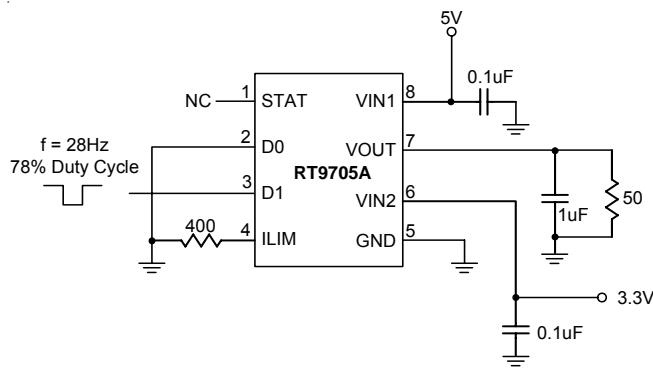

Table 1. Truth Table

| D1 | D0 | $V_{IN2} > V_{IN1}$ | STAT | V_{OUT} |
|----|----|---------------------|------|-----------|
| 0 | 0 | X | Hi-Z | V_{IN2} |
| 0 | 1 | No | 0 | V_{IN1} |
| 0 | 1 | Yes | Hi-Z | V_{IN2} |
| 1 | 0 | X | 0 | V_{IN1} |
| 1 | 1 | X | 0 | 0 |

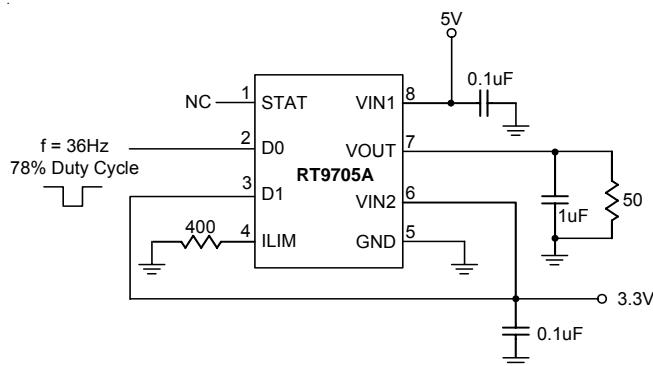

Notes for Table 1.

1. X : Don't care
2. Hi-Z: High impedance node
3. D0 and D1 cannot be floating which will lead to an unknown state.
4. An internal MOSFET with $2k\Omega$ $R_{DS(ON)}$ turns on and softly discharges the output voltage when $D0 = D1 = 1$.

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. Devices are ESD sensitive. Handling precaution recommended.

Note 3. The device is not guaranteed to function outside its operating conditions.

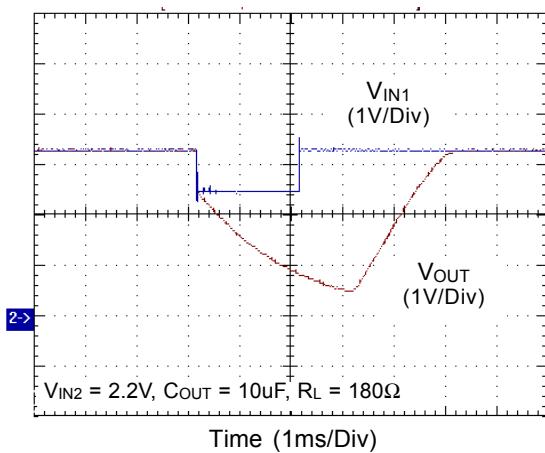

Note 4. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

Note 5. Performance at $-5^\circ C \leq T_A \leq 85^\circ C$ is assured by design.

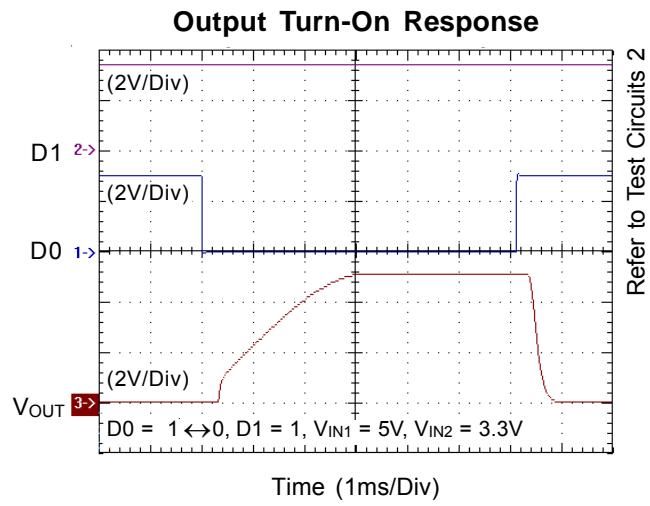

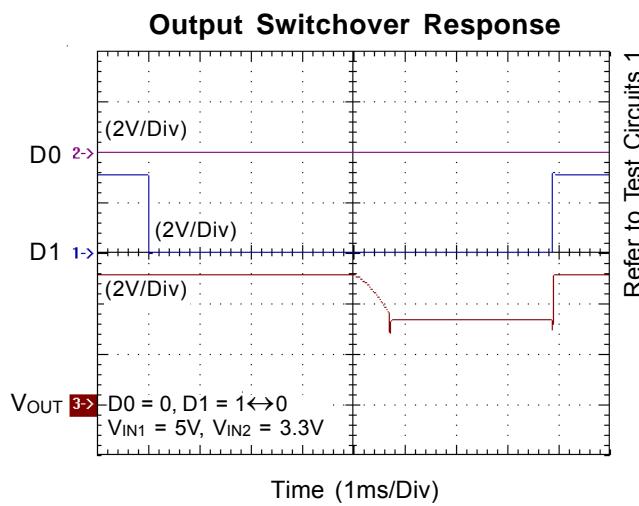

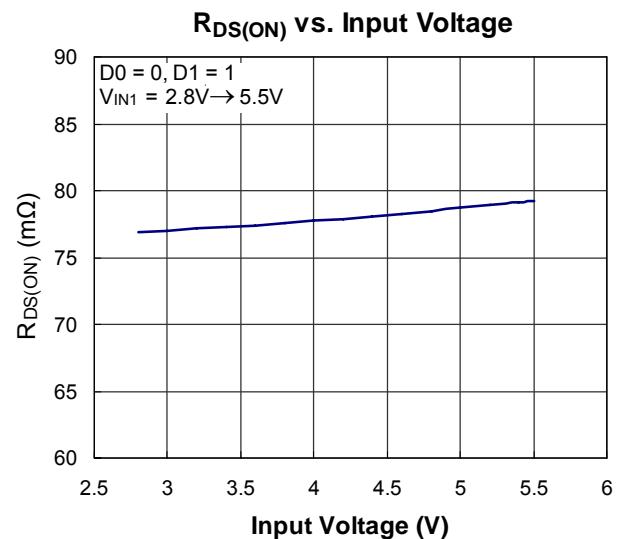

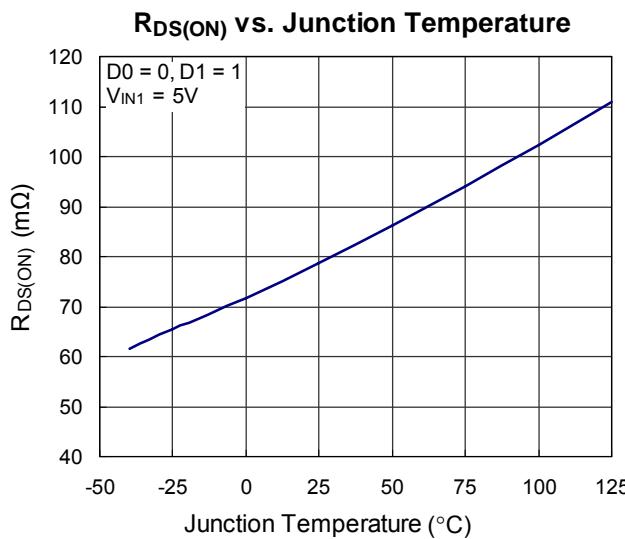

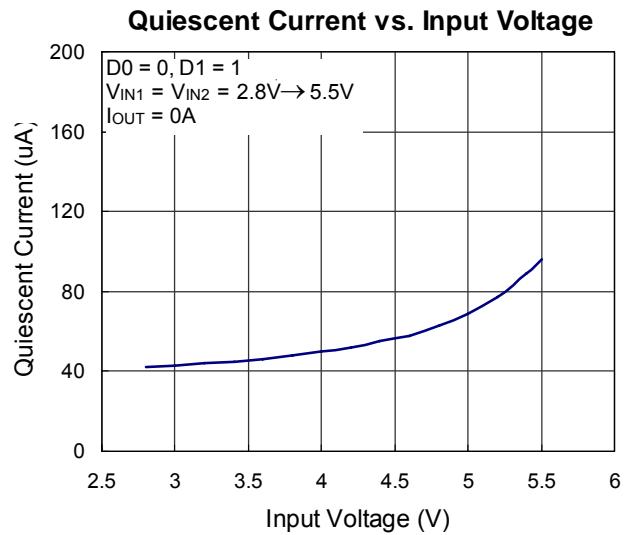

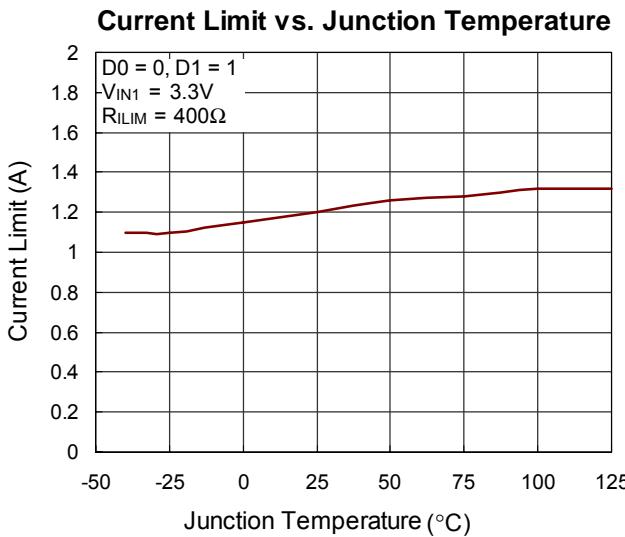

Note 6. The time is assured by design.

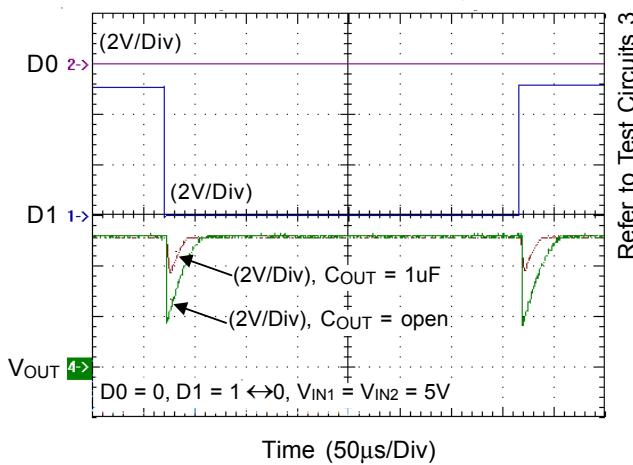

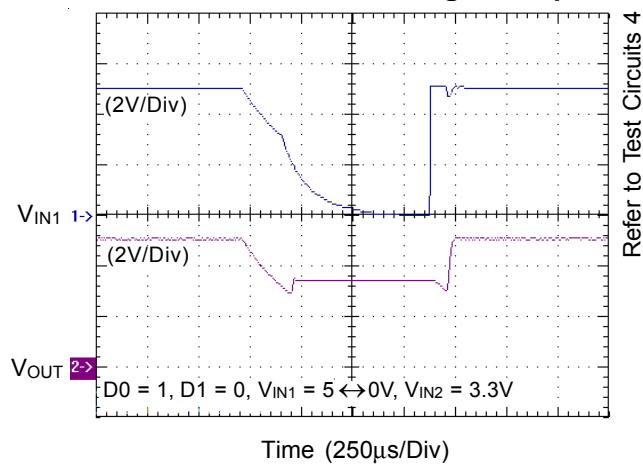

Note 7. The UVLO is without latch. In V_{IN} falling dege, the output voltage will depend on I_{OUT} and C_{OUT} . Please see below curve as reference.

Application Information

The RT9705A is dual input single output power multiplexer specifically designed to provide seamless voltage transition between two independent power suppliers. Equipped with two low $R_{DS(ON)}$ N-Channel MOSFETs driven by internal charge pump circuitry, the RT9705A is able to deliver 1A output current with only 80mV voltage drop. The RT9705A provides comprehensive protection functions, including adjustable current limit, over temperature protection, soft start function for minimum inrush current, cross-conduction protection, and reverse conduction protection. These features greatly simplify power multiplexer design.

Manual Switching Mode

The RT9705A provides two logic input D0 and D1 for switch selection as shown in Table 1. The RT9705A selects the manual-switching mode when the D0 is pulled low. In this mode V_{OUT} connects to V_{IN1} if D1 pulled high, otherwise V_{OUT} connects to V_{IN2} .

Auto Switching Mode

RT9705A selects the auto-switching mode when the D0 is pulled high and D1 is pulled low. In this mode V_{OUT} connects to the higher of V_{IN1} and V_{IN2} .

Shutdown Mode

When both D0 and D1 are selected high, the RT9705A enters shutdown mode and consumes minimum power. An internal MOSFET with $2k\Omega R_{DS(ON)}$ turns on and softly discharges the output voltage in the shutdown mode. Since no body diode exists between V_{INX} and V_{OUT} , output voltage is allowed to be high than the input voltages in the shutdown mode.

Switch Status Indication

A STAT pin with open drain output is provided to indicate the switch status. STAT pin outputs high impedance if V_{IN2} is active, otherwise STAT pin outputs low.

Current Limiting

The current limit circuitry prevents damage to the MOSFET switch and external load. A resistor R_{ILIM} from ILIM to GND sets the current limit to $500/R_{ILIM}$ and the adjustable current limiting up to 1.25 A. A setting resistor R_{ILIM} equal to zero is not recommended as that disables current limiting.

Thermal Considerations

Thermal protection limits power dissipation in RT9705A. When the operation junction temperature exceeds 135°C, the OTP circuit starts the thermal shutdown function and turns the pass element off. The pass element turn on again after the junction temperature cools by 10°C.

For continuous operation, do not exceed absolute maximum operation junction temperature 125°C. The power dissipation definition in device is:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_Q$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient. The maximum power dissipation can be calculated by following formula:

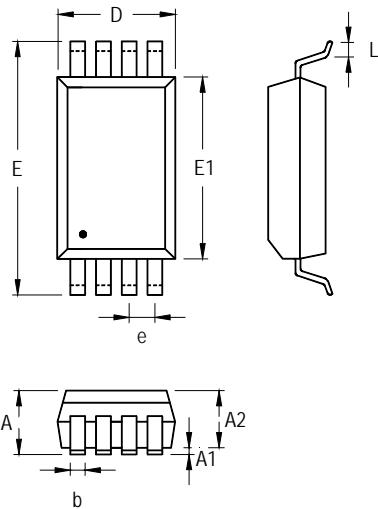

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum operation junction temperature 125°C, T_A is the ambient temperature and the θ_{JA} is the junction to ambient thermal resistance.

For recommended operating conditions specification of RT9705A, where $T_{J(MAX)}$ is the maximum junction temperature of the die (125°C) and T_A is the maximum ambient temperature. The junction to ambient thermal resistance (θ_{JA} is layout dependent) for TSSOP-8 package is 230°C/W on standard JEDEC 51-3 thermal test board. The maximum power dissipation at $T_A = 25^\circ C$ can be calculated by following formula:

$$P_{D(MAX)} = (125^\circ C - 25^\circ C) / 230^\circ C/W = 430 \text{ mW (TSSOP-8)}$$
