Application note:

This tube can be used without precautions against microphony in equipment which is characterized by $V_i \geq 10mV$ for an output of 50mW of the output tube (or $V_i \geq 100mV$ for 5W output), provided that average acceleration of the tube is not greater than indicated in the Section "Microphonic effect" from the "Application directions". When the center tap of the heater transformer is grounded, $R_g \leq 0,3M\Omega$ and R_k is sufficiently decoupled, and the disturbance level from hum and noise will be better than 60dB below 100mV.
