Description

The 5P49V6975 is a programmable clock generator intended for high-performance consumer, networking, industrial, computing, and data-communications applications. The device is a member of IDT's sixth generation of programmable clock technology, VersaClock 6E.

The 5P49V6975 contains an internal crystal, which eliminates the need for external crystal and load cap tuning.

Two select pins allow up to four different configurations to be programmed, and can be used for different operating modes (full function, partial function, partial power-down), regional standards (US, Japan, Europe) or system production margin testing. The 5P49V6975 can be configured to use one of two I2C addresses to allow the use of multiple devices in a system.
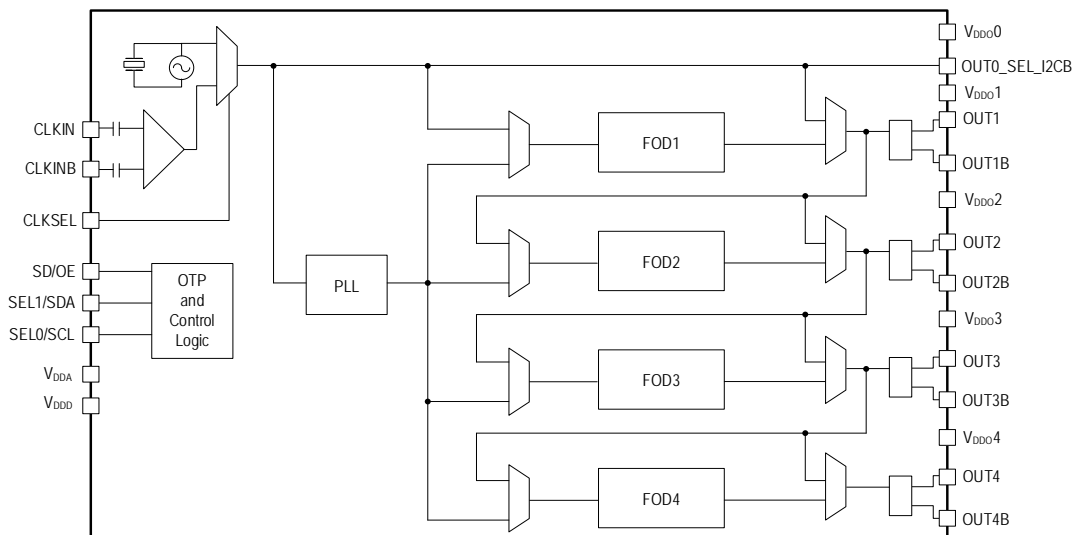

Typical Applications

- Ethernet switch/router
- PCI Express 1–4
- Broadcast video/audio timing
- Multi-function printer
- Processor and FPGA clocking
- Any-frequency clock conversion
- MSAN/DSLAM/PON
- Fiber Channel, SAN
- Telecom line cards
- Laser distance sensing

Features

- Internal crystal input integrated into package
- Flexible 1.8V, 2.5V, 3.3V power rails
- High-performance, low phase noise PLL, < 0.5ps RMS typical phase jitter on outputs
- Four banks of internal OTP memory
  — In-system or factory programmable
  — Two select pins accessible with processor GPIOs or bootstrapping
- I2C serial programming interface
  — 0xD0 or 0xD4 I2C address options allow multiple devices configured in a same system
- Reference LVCMOS output clock
- Four universal output pairs individually configurable:
  — Differential (LVPECL, LVDS, or HCSL)
  — Two single-ended (2 LVCMOS in-phase or 180 degrees out of phase)
  — I/O VDDs can be mixed and matched, supporting 1.8V (LVDS and LVCMOS), 2.5V, or 3.3V
  — Independent spread spectrum on each output pair
- Output frequency ranges:
  — LVCMOS clock outputs: 1kHz to 200MHz
  — LVDS, LVPECL, HCSL differential clock outputs: 1kHz to 350MHz
- Programmable output enable or power-down mode
- Available in 4 × 4 mm 24-LGA package
- -40° to +85°C industrial temperature operation

4 × 4 mm 24-LGA

2. Pin Descriptions

Table 1.   Pin Descriptions

Number	Name	Type		Description
1	CLKIN	Input	Internal Pull-down	Differential clock input. Weak 100kΩ internal pull-down.
2	CLKINB	Input	Internal Pull-down	Complementary differential clock input. Weak 100kΩ internal pull-down.
3	NC			No connect.
4	NC			No connect
5	V_{DDA}	Power		Analog functions power supply pin. Connect to 1.8V to 3.3V. V_{DDA} and V_{DDD} should have the same voltage applied.
6	CLKSEL	Input	Internal Pull-down	Input clock select. Selects the active input reference source in manual switchover mode. 0 = Internal crystal (default). 1 = CLKIN, CLKINB. For more information, see Table 19.

Number	Name	Type		Description
7	SD/OE	Input	Internal Pull-down	Enables/disables the outputs (OE) or powers down the chip (SD).
8	SEL1/SDA	Input	Internal Pull-down	Configuration select pin, or I^{2}C SDA input as selected by OUT0_SEL_I2CB. Weak internal pull-down resistor.
9	SEL0/SCL	Input	Internal Pull-down	Configuration select pin, or I^{2}C SCL input as selected by OUT0_SEL_I2CB. Weak internal pull-down resistor.
10	$V_{DDO}4$	Power		Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT4/OUT4B.
11	OUT4	Output		Output clock 4. For more information, see "Output Drivers."
12	OUT4B	Output		Complementary output clock 4. For more information, see "Output Drivers."
13	OUT3B	Output		Complementary output clock 3. For more information, see "Output Drivers."
14	OUT3	Output		Output clock 3. For more information, see "Output Drivers."
15	$V_{DDO}3$	Power		Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT3/OUT3B.
16	OUT2B	Output		Complementary output clock 2. For more information, see "Output Drivers."
17	OUT2	Output		Output clock 2. For more information, see "Output Drivers."
18	$V_{DDO}2$	Power		Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT2/OUT2B.
19	OUT1B	Output		Complementary output clock 1. For more information, see "Output Drivers."
20	OUT1	Output		Output clock 1. For more information, see "Output Drivers."
21	$V_{DDO}1$	Power		Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT1/OUT1B.
22	V_{DDD}	Power		Digital functions power supply pin. Connect to 1.8 to 3.3V. V_{DDA} and V_{DDD} should have the same voltage applied.
23	$V_{DDO}0$	Power		Power supply pin for OUT0_SEL_I2CB. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT0.
24	OUT0_SEL _I2CB	Input/ Output	Internal Pull-down	Latched input/LVCMOS output. At power-up, the voltage at the pin OUT0_SEL_I2CB is latched by the part and used to select the state of pins 8 and 9. If a weak pull-up (10kΩ) is placed on OUT0_SEL_I2CB, pins 8 and 9 are configured as hardware select pins, SEL1 and SEL0. If a weak pull-down (10kΩ) is placed on OUT0_SEL_I2CB or it is left floating, pins 8 and 9 will act as the SDA and SCL pins of an I^{2}C interface. After power-up, the pin acts as an LVCMOS reference output.
EPAD	GND	GND		Connect to ground pad.

3. Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the device at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 2.   Absolute Maximum Ratings

Item	Rating
Supply Voltage, V_{DDA}, V_{DDD}, V_{DDO}	3.63V
Internal Crystal	1.2V
CLKIN, CLKINB Input	VDDO0, 1.2V voltage swing
I²C Loading Current (SDA)	10mA
Storage Temperature, TSTG	-65°C to 150°C
ESD Human Body Model	2000V

4. Thermal Characteristics

Table 3.   Thermal Characteristics

Symbol	Parameter	Value	Units
θ_{JA}	Theta JA. Junction to air thermal impedance (0mps)	75.98	°C/W
θ_{JB}	Theta JB. Junction to board thermal impedance (0mps)	24.3	°C/W
θ_{JC}	Theta JC. Junction to case thermal impedance (0mps)	57.32	°C/W

5. Recommended Operating Conditions

Table 4.   Recommended Operating Conditions

Symbol	Parameter	Minimum	Typical	Maximum	Units
V_{DDOX}	Power supply voltage for supporting 1.8V outputs.	1.71	1.8	1.89	V
	Power supply voltage for supporting 2.5V outputs.	2.375	2.5	2.625	V
	Power supply voltage for supporting 3.3V outputs.	3.135	3.3	3.465	V
V_{DDD}	Power supply voltage for core logic functions.	1.71		3.465	V
V_{DDA}	Analog power supply voltage. Use filtered analog power supply.	1.71		3.465	V
T_A	Operating temperature, ambient.	-40		85	°C
C_L	Maximum load capacitance (3.3V LVCMOS only).			15	pF

6. Electrical Characteristics

Table 5.   Current Consumption Characteristics

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
I_{DDCORE}[a]	Core Supply Current	100MHz on all outputs.		33	42	mA
I_{DDOX}	Output Buffer Supply Current	LVPECL, 350MHz, 3.3V V_{DDOx}.		45	58	mA
		LVPECL, 350MHz, 2.5V V_{DDOx}.		36	47	mA
		LVDS, 350MHz, 3.3V V_{DDOx}.		26	32	mA
		LVDS, 350MHz, 2.5V V_{DDOx}.		25	30	mA
		LVDS, 350MHz, 1.8V V_{DDOx}.		22	27	mA
		HCSL, 250MHz, 3.3V V_{DDOx} [b]		39	48	mA
		HCSL, 250MHz, 2.5V V_{DDOx} [b]		37	46	mA
		LVCMOS, 50MHz, 3.3V, V_{DDOx} [b],[c]		22	27	mA
		LVCMOS, 50MHz, 2.5V, V_{DDOx} [b],[c]		20	24	mA
		LVCMOS, 50MHz, 1.8V, V_{DDOx} [b],[c]		17	21	mA
		LVCMOS, 200MHz, 3.3V V_{DDOx} [b],[c]		43	56	mA
		LVCMOS, 200MHz, 2.5V V_{DDOx} [b],[c]		33	43	mA
		LVCMOS, 200MHz, 1.8V V_{DDOx} [b],[c]		24	31	mA
I_{DDPD}	Power Down Current	SD asserted, I^2C programming.		10	12	mA

[a] I_{DDCORE} = I_{DDA} + I_{DDD}, no loads.

[b]   Measured into a 5″ 50Ω trace with a 2pF load. See Test Loads section for more details.

[c]   Single CMOS driver active.

Table 6.   General AC Timing Characteristics

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
F_{IN} [a]	Input Frequency	Input frequency limit (CLKIN,CLKINB)	1		350	MHz
F_{OUT} [b]	Output Frequency	Single-ended clock output limit (LVCMOS), individual FOD mode.	1		200	MHz
		Differential clock output (LVPECL/LVDS/HCSL), individual FOD mode.	1		350	
		Single-ended clock output limit (LVCMOS), cascaded FOD mode, output 2–4.	0.001		200	
		Differential clock output limit (LVPECL/LVDS/HCSL), cascaded FOD mode, output 2–4.	0.001		350	
f_{VCO}	VCO Frequency Range		2500		2900	MHz
T_{DC} [c]	Output Duty Cycle	Measured at V_{DD}/2, all outputs except reference output, V_{DDOX} = 2.5V or 3.3V.	45	50	55	%
		Measured at V_{DD}/2, all outputs except reference output, V_{DDOX} = 1.8V.	40	50	60	%
		Measured at V_{DD}/2, reference output OUT0 (5MHz–150.1MHz) with 50% duty cycle input.	40	50	60	%
		Measured at V_{DD}/2, reference output OUT0 (150.1MHz–200MHz) with 50% duty cycle input.	30	50	70	%
T_{SKEW}	Output Skew	Skew between the same frequencies, with outputs using the same driver format and 0 phase delay.		75		ps
$T_{STARTUP}$ [d] [e]	Startup Time	Measured after all V_{DD}s have raised above 90% of their target value. [f]			30	ms
		PLL lock time from shutdown mode.		3	4	ms
$T_{CRYSTAL}$	Frequency Stability	Initial frequency accuracy at 25°C.		±2		ppm
		Frequency stability across temperature.			±20	ppm
		Crystal aging first year.		±3		ppm
		Frequency stability over 10 years all inclusive (temperature and aging).			±50	ppm

[a]   Practical lower frequency is determined by loop filter settings.

[b]   A slew rate of 2.75V/ns or greater should be selected for output frequencies of 100MHz or higher.

[c]   Duty cycle is only guaranteed at maximum slew rate settings.

[d]   Actual PLL lock time depends on the loop configuration.

[e]   Includes loading the configuration bits from EPROM to PLL registers. It does not include EPROM programming/write time.

[f]   Power-up with temperature calibration enabled, please contact IDT if shorter lock-time is required in system.

Table 7. General Input Characteristics

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Pins	Minimum	Typical	Maximum	Units
C_{IN}	Input Capacitance	CLKIN,CLKINB,CLKSEL,SD/OE,SEL1/SDA, SEL0/SCL		3	7	pF
R_{PD}	Pull-down Resistor	CLKSEL, SD/OE, SEL1/SDA, SEL0/SCL, CLKIN, CLKINB, OUT0_SEL_I2CB	100		300	kΩ
V_{IH}	Input High Voltage	CLKSEL, SD/OE	0.7 x V_{DDD}		V_{DDD} + 0.3	V
V_{IL}	Input Low Voltage	CLKSEL, SD/OE	GND - 0.3		0.3 x V_{DDD}	V
V_{IH}	Input High Voltage	OUT0_SEL_I2CB	0.65 x		V_{DDO0} + 0.3	V
V_{IL}	Input Low Voltage	OUT0_SEL_I2CB	GND - 0.3		0.4	V
V_{IH}	Input High Voltage	Internal crystal	0.8		1.2	V
V_{IL}	Input Low Voltage	Internal crystal	GND - 0.3		0.4	V
T_R/T_F	Input Rise/Fall Time	CLKSEL, SD/OE, SEL1/SDA, SEL0/SCL			300	ns

Table 8. CLKIN Electrical Characteristics

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V_{SWING}	Input Amplitude – CLKIN, CLKINB	Peak to peak value, single-ended.	200		1200	mV
dv/dt	Input Slew Rate – CLKIN, CLKINB	Measured differentially.	0.4		8	V/ns
I_{IL}	Input Leakage Low Current	V_{IN} = GND.	-5		5	µA
I_{IH}	Input Leakage High Current	V_{IN} = 1.7V.			20	µA
DC_{IN}	Input Duty Cycle	Measurement from differential waveform.	45		55	%

Table 9. Electrical Characteristics – CMOS Outputs

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V_{OH}	Output High Voltage	IOH = -15mA (3.3V), -12mA (2.5V), -8mA (1.8V).	0.7 x V_{DDO}		V_{DDO}	V
V_{OL}	Output Low Voltage	IOH = 15mA (3.3V), 12mA (2.5V), 8mA (1.8V) .			0.4	V
R_{OUT}	Output Driver Impedance	CMOS output driver.		17		Ω
T_{SR}	Slew Rate, SLEW[1:0] = 00	Single-ended 3.3V LVCMOS output clock rise and fall time, 20% to 80% of VDDO (output load = 5pF) V_{DDOX} = 3.3V.	1.0	2.2		V/ns
	Slew Rate, SLEW[1:0] = 01		1.2	2.3		
	Slew Rate, SLEW[1:0] = 10		1.3	2.4		
	Slew Rate, SLEW[1:0] = 11		1.7	2.7		
	Slew Rate, SLEW[1:0] = 00	Single-ended 2.5V LVCMOS output clock rise and fall time, 20% to 80% of VDDO (output load = 5pF) V_{DDOX} = 2.5V.	0.6	1.3		
	Slew Rate, SLEW[1:0] = 01		0.7	1.4		
	Slew Rate, SLEW[1:0] = 10		0.6	1.4		
	Slew Rate, SLEW[1:0] = 11		1.0	1.7		
	Slew Rate, SLEW[1:0] = 00	Single-ended 1.8V LVCMOS output clock rise and fall time, 20% to 80% of VDDO (output load = 5pF) VDD = 1.8V.	0.3	0.7		
	Slew Rate, SLEW[1:0] = 01		0.4	0.8		
	Slew Rate, SLEW[1:0] = 10		0.4	0.9		
	Slew Rate, SLEW[1:0] = 11		0.7	1.2		
I_{OZDD}	Output Leakage Current (OUT1–4)	Tri-state outputs.			5	μA
	Output Leakage Current (OUT0)	Tri-state outputs.			30	μA

Table 10. Electrical Characteristics – LVDS Outputs

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Minimum	Typical	Maximum	Units
V_{OT} (+)	Differential Output Voltage for the TRUE Binary State	247		454	mV
V_{OT} (-)	Differential Output Voltage for the FALSE Binary State	-454		-247	mV
ΔV_{OT}	Change in V_{OT} between Complimentary Output States			50	mV
V_{OS}	Output Common Mode Voltage (Offset Voltage) at 3.3V±5%, 2.5V±5%	1.125	1.25	1.375	V
	Output Common Mode Voltage (Offset Voltage) at 1.8V±5%	0.8	0.875	0.96	V
ΔV_{OS}	Change in V_{OS} between Complimentary Output States			50	mV
I_{OS}	Outputs Short Circuit Current, V_{OUT+} or V_{OUT} - = 0V or V_{DDO}		9	24	mA
I_{OSD}	Differential Outputs Short Circuit Current, V_{OUT+} = V_{OUT-}		6	12	mA
T_R	LVDS Rise Time 20%-80%		300		ps
T_F	LVDS Fall Time 80%-20%		300		ps

Table 11. Electrical Characteristics – LVPECL Outputs

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Minimum	Typical	Maximum	Units
V_{OH}	Output Voltage High, terminated through 50Ω tied to V_{DD} - 2V	V_{DDO} - 1.19		V_{DDO} - 0.69	V
V_{OL}	Output Voltage Low, terminated through 50Ω tied to V_{DD} - 2V	V_{DDO} - 1.94		V_{DDO} - 1.4	V
V_{SWING}	Peak-to-Peak Output Voltage Swing	0.55		0.993	V
T_R	LVPECL Rise Time 20%-80%		400		ns
T_F	LVPECL Fall Time 80%-20%		400		ns

Table 12. Electrical Characteristics – HCSL Outputs[a]

V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V ±5%, 2.5V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
dV/dt	Slew Rate	Scope averaging on. [b] [c]	1		4	V/ns
ΔdV/dt	Slew Rate Matching	Scope averaging on. [b] [c]			20	%
V_{MAX}	Maximum Voltage	Measurement on single-ended signal using absolute value (scope averaging off).			1150	mV
V_{MIN}	Minimum Voltage		-300			mV
V_{SWING}	Voltage Swing	Scope averaging off. [b] [f]	300			mV
V_{CROSS}	Crossing Voltage Value	Scope averaging off. [d] [f]	250		550	mV
$ΔV_{CROSS}$	Crossing Voltage Variation	Scope averaging off. [e]			140	mV

[a] Guaranteed by design and characterization. Not 100% tested in production.

[b] Measured from differential waveform.

[c] Slew rate is measured through the VSWING voltage range centered around differential 0V. This results in a ±150mV window around differential 0V.

[d] V_{CROSS} is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e., Clock rising and Clock# falling).

[e] The total variation of all V_{CROSS} measurements in any particular system. Note that this is a subset of V_{CROSS} min/max (V_{CROSS} absolute) allowed. The intent is to limit V_{CROSS} induced modulation by setting Δ V_{CROSS} to be smaller than V_{CROSS} absolute.

[f] Measured from single-ended waveform.

Table 13. Spread-Spectrum Generation Specifications

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
f_{SSOUT}	Spread Frequency	Output frequency range for spread spectrum	5		300	MHz
f_{MOD}	Mod Frequency	Modulation frequency.		30 to 63		kHz
f_{SPREAD}	Spread Value	Amount of spread value (programmable)–center spread.		±0.1% to ±2.5%		%f_{OUT}
		Amount of spread value (programmable)–down spread.		-0.2% to -5%		

Table 14.   I²C Bus (SCL/SDA) DC Characteristics

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V_{IH}	Input High Level	For SEL1/SDA pin and SEL0/SCL pin.	$0.7 \times V_{DDD}$			V
V_{IL}	Input Low Level	For SEL1/SDA pin and SEL0/SCL pin.			$0.3 \times V_{DDD}$	V
V_{HYS}	Hysteresis of Inputs		$0.05 \times V_{DDD}$			V
I_{IN}	Input Leakage Current		-1		30	µA
V_{OL}	Output Low Voltage	$I_{OL} = 3mA.$			0.4	V

Table 15.   I²C Bus (SCL/SDA) AC Characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Units
F_{SCLK}	Serial Clock Frequency (SCL)	10		400	kHz
t_{BUF}	Bus Free Time between Stop and Start	1.3			µs
$t_{SU:START}$	Setup Time, Start	0.6			µs
$t_{HD:START}$	Hold Time, Start	0.6			µs
$t_{SU:DATA}$	Setup Time, Data Input (SDA)	0.1			µs
$t_{HD:DATA}$	Hold Time, Data Input (SDA) [1]	0			µs
t_{OVD}	Output Data Valid from Clock			0.9	µs
C_B	Capacitive Load for Each Bus Line			400	pF
t_R	Rise Time, Data and Clock (SDA, SCL)	$20 + 0.1 \times C_B$		300	ns
t_F	Fall Time, Data and Clock (SDA, SCL)	$20 + 0.1 \times C_B$		300	ns
t_{HIGH}	High Time, Clock (SCL)	0.6			µs
t_{LOW}	Low Time, Clock (SCL)	1.3			µs
$t_{SU:STOP}$	Setup Time, Stop	0.6			µs

[a]   A device must internally provide a hold time of at least 300ns for the SDA signal (referred to the $V_{IH(MIN)}$ of the SCL signal) to bridge the undefined region of the falling edge of SCL.

[b]   I²C inputs are 5V tolerant.

	$t_{jphPCIeG3-SRNS}$	PCIe Gen 3(SSC OFF) (PLL BW of 2-4MHz or 2-5MHz, CDR = 10MHz)		0.32		0.7	ps (rms)

[a] Guaranteed by design and characterization, not 100% tested in production.

[b] Based on PCIe Base Specification Rev4.0 version 0.7draft. For the latest specification, see www.pcisig.com.

[c] Sample size of at least 100K cycles. This figure extrapolates to 108ps pk-pk at 1M cycles for a BER of 1-12.

[d] According to the PCIe Base Specification Rev4.0 version 0.7 draft, the jitter transfer functions and corresponding jitter limits are not defined for the IR clock architecture. Widely accepted industry limits using widely accepted industry filters are used to populate this table. There are no accepted filters or limits for IR clock architectures at PCIe Gen1 or Gen4 data rates.

[e] IR(Independent Reference) is the new name for Separate Reference Independent Spread (SRIS) and Separate Reference no Spread (SRNS) PCIe clock architectures.

10. Features and Functional Blocks

10.1 Device Startup and Power-on-Reset

The 5P49V6975 has an internal power-up reset (POR) circuit. All VDDs must be connected to the desired supply voltage to trigger a POR.

The user can define specific default configurations through internal One-Time-Programmable (OTP) memory -- either the user or factory can program the default configuration. Contact IDT if a specific factory-programmed default configuration is required, or refer to the *VersaClock 6E Programming Guide.*

The device will identity which of the two modes to operate in by the state of the OUT0_SEL_I2CB pin at POR. Both modes' default configurations can be programmed as follows:

1. **Software Mode (I2C):** OUT0_SEL_I2CB is low at POR.

   The I2C interface will be open to users for in-system programming, overriding device default configurations at any time.

2. **Hardware Select Mode:** OUT0_SEL_I2CB is high at POR.

   The device has been programmed to load OTP at power-up (REG0[7] = 1). The device will load internal registers according to Table 18.

   Internal OTP memory can support up to four configurations, which selectable by the SEL0/SEL1 pins.

   At POR, logic levels at SEL0 and SEL1 pins must be settled, which results in the selected configuration to be loaded at power up.

   After the first 10ms of operation, the levels of the SELx pins can be changed, either to low or to the same level as VDDD/VDDA. The SELx pins must be driven with a digital signal of < 300ns rise/fall time and only a single pin can be changed at a time. After a pin level change, the device must not be interrupted for at least 1ms so that the new values have time to load and take effect.

Table 18.   Power-Up Behavior

OUT0_SEL_I2CB at POR	SEL1	SEL0	I2C Access	REG0:7	Config
1	0	0	No	0	0
1	0	1	No	0	1
1	1	0	No	0	2
1	1	1	No	0	3
0	X	X	Yes	1	I2C defaults
0	X	X	Yes	0	0

10.2 Reference Clock and Selection

The 5P49V6975 supports up to two clock inputs:

- Internal crystal input: This can be driven by a single ended clock.
- Clock input (CLKIN, CLKINB): This is a fully differential input that only accepts a reference clock. A single-ended clock can also drive it on CLKIN.

Figure 7. Clock Input Diagram Internal Logic
10.3 Manual Switchover

The CLKSEL pin selects the input clock between either the internal crystal or (CLKIN, CLKINB). CLKSEL polarity can be changed by I2C programming (Byte 0x13[1]) as shown in the following table.

- 0 = Internal crystal (default)
- 1 = CLKIN, CLKINB

Table 19. Input Clock Select

PRIMSRC	CLKSEL	Source
0	0	Internal crystal
0	1	CLKIN, CLKINB
1	0	CLKIN, CLKINB
1	1	Internal crystal

When SM[1:0] is "0x", the redundant inputs are in manual switchover mode. In this mode, CLKSEL pin is used to switch between the primary and secondary clock sources. The PRIMSRC bit determines the primary and secondary clock source setting. During the switchover, no glitches will occur at the output of the device, although there may be frequency and phase drift depending on the exact phase and frequency relationship between the primary and secondary clocks.

10.4 Programmable Loop Filter

The device PLL loop bandwidth operating range depends on the input reference frequency (Fref).

Table 20. Loop Filter Settings

Input Reference Frequency (MHz)	Loop Bandwidth Minimum (kHz)	Loop Bandwidth Maximum (kHz)
1	40	126
350	300	1000

10.5 Fractional Output Dividers (FOD)

The 5P49V6975 has four fractional output dividers (FOD). Each FOD is comprised of a 12-bit integer counter and a 24-bit fractional counter. The output divider can operate in integer divide only mode for improved performance, or use the fractional counters to generate a clock frequency accurate to 50ppb.

FODs support the following features.

10.5.1 Individual Spread Spectrum Modulation

The output clock frequencies can be modulated to spread energy across a broader range of frequencies, thereby lowering system EMI. Each divider has individual spread ability. Spread modulation independent of output frequency, a triangle wave modulation between 30 and 63kHz.

Spread spectrum can be applied to any output clock, clock frequency, or spread amount from ±0.25% to ±2.5% center-spread and -0.5% to -5% down-spread.

10.5.2 Bypass Mode

Bypass mode (divide by 1) allows the output to behave as a buffered copy from the input or another FOD.

10.5.3 Cascaded Mode

As shown in the block diagram on page 1, FODs can be cascaded for lower output frequency.

For example, if OUT1 is configured to run at 12.288MHz and needs another 48kHz output, the user can cascade FOD2 by taking input from OUT1, with a divide ratio of 256. As a result, OUT 2 runs at 48kHz while in alignment with 12.288MHz on OUT1.

10.5.4 Dividers Alignment

Each output divider block has a synchronizing pulse to provide startup alignment between outputs dividers. This allows alignment of outputs for low skew performance.

When the 5P49V6975 is in hardware select mode, outputs are automatically aligned at POR. The same synchronization reset is also triggered when switching between configurations with the SEL0/1 pins. This ensures that the outputs remain aligned in every configuration.

When the 5P49V6975 is using software mode, I2C is used to reprogram an output divider during operation, and therefore, alignment can be lost. Alignment can be restored by manually triggering a reset through I2C.

The outputs are aligned on the falling edges of each output by default. Rising edge alignment can also be achieved by using the programmable skew feature to delay the faster clock by 180 degrees. The programmable skew feature also allows for fine tuning of the alignment.

10.5.5 Programmable Skew

The 5P49V6975 can skew outputs by quadrature values. The skew on each output can be adjusted from 0 to 360 degrees. Skew is adjusted in units equal to 1/32 of the VCO period. As a result, for 100MHz output and a 2800MHz VCO, the user can select how many 11.161ps units to be added to the skew (resulting in units of 0.402 degrees). For example, 0, 0.402, 0.804, 1.206, 1.408, and so on. The granularity of the skew adjustment is always dependent on the VCO period and the output period.

10.6 Output Drivers

Device output drivers can individually support the following features:

- 2.5V or 3.3V voltage level for HCSL/LVPECL operation
- 1.8V, 2.5V, or 3.3V voltage levels for CMOS/LVDS operation
- CMOS supports four operating modes:
  — CMOSD: OUTx and OUTxB 180 degrees out of phase
  — CMOSX2: OUTx and OUTxB phase-aligned
  — CMOS1: only OUTx pin is on
  — CMOS2: only OUTxB pin is on
  When a given output is configured to CMOSD or CMOSX2, then all previously described configuration and control apply equally to both pins.
- Independent output enable/disabled by register bits. When disabled, an output can be either in a logic 1 state or Hi-Z.

The following options are used to disable outputs:

- Output turned off by I^{2}C
- Output turned off by SD/OE pin
- Output unused, which means it is turned off regardless of OE pin status

10.7 SD/OE Pin Function

The SD/OE pin can be programmed as follows:

- OE output enable (low active)
- OE output enable (high active)
- Global shutdown (low active)
- Global shutdown (high active)

Output behavior when disabled is also programmable. The user can select the output driver behavior when it is off as follows:

- OUTx pin high, OUTxB pin low (controlled by SD/OE pin)
- OUTx/OUTxB Hi-Z (controlled by SD/OE pin)
- OUTx pin high, OUTxB pin low (configured through I^{2}C)
- OUTx/OUTxB Hi-Z (configured by I^{2}C)

The user can disable the output with either I^{2}C or SD/OE pin. For more information, see the *VersaClock 6E Programming Guide*.

10.8 I²C Operation

The 5P49V6975 acts as a slave device on the I²C bus using one of the two I²C addresses (0xD0 or 0xD4) to allow multiple devices to be used in the system. The interface accepts byte-oriented block write and block read operations.

Address bytes (2 bytes) specify the register address of the byte position of the first register to write or read.

Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first).

Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I²C compliance, use external pull-up resistors for SDATA and SCLK.

11. Typical Application Circuit

Figure 9. Typical Application Circuit
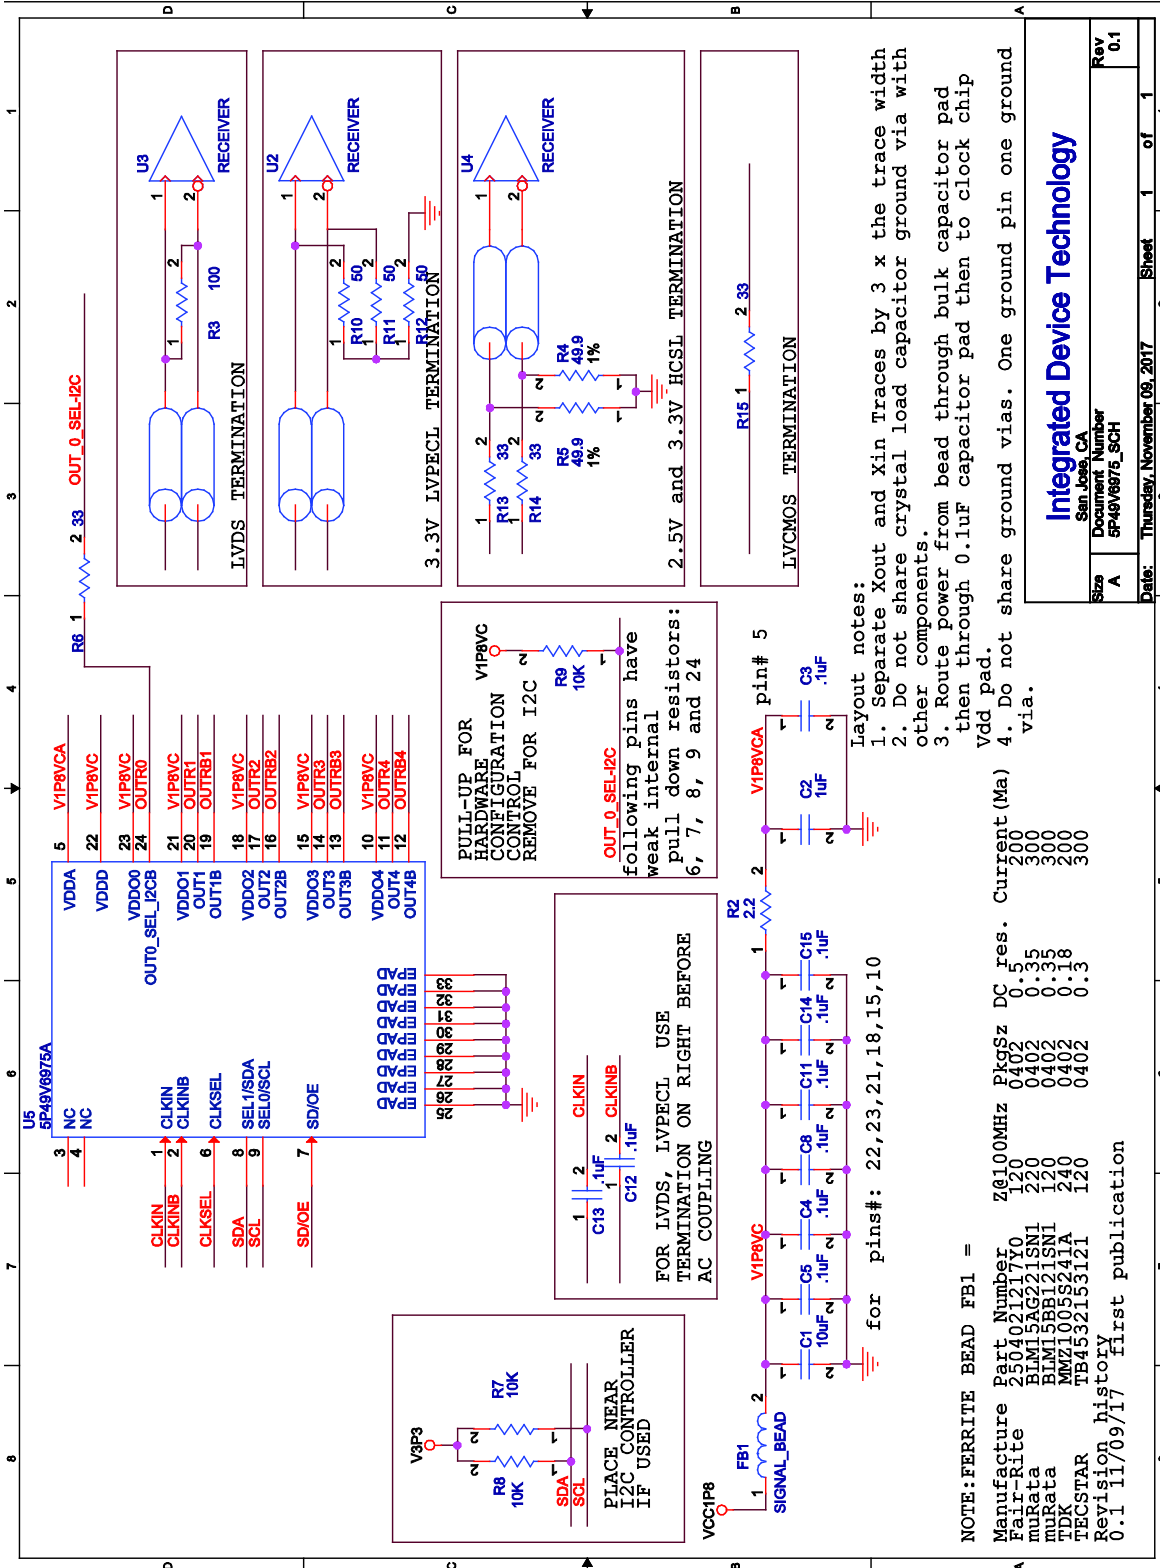

11.1 Input – Driving the CLKIN

11.1.1 Wiring the CLKIN Pin to Accept Single-Ended Inputs

CLKIN cannot take a signal larger than 1.2V pk-pk due to the 1.2V regulated input inside. However, since it is internally AC coupled it can accept both LVDS and LVPECL input signals.

Occasionally it may be desired to have CLKIN to take CMOS levels. The following example shows how this can be achieved. This configuration has three properties:

1. Total output impedance of Ro and Rs matches the 50Ω transmission line impedance
2. Vrx voltage is generated at the CLKIN, which maintains the LVCMOS driver voltage level across the transmission line for best S/N
3. R1–R2 voltage divider values ensure that Vrx p-p at CLKIN is less than the maximum value of 1.2V

Figure 10. Recommended Schematic for Driving CLKIN with LVCMOS Driver
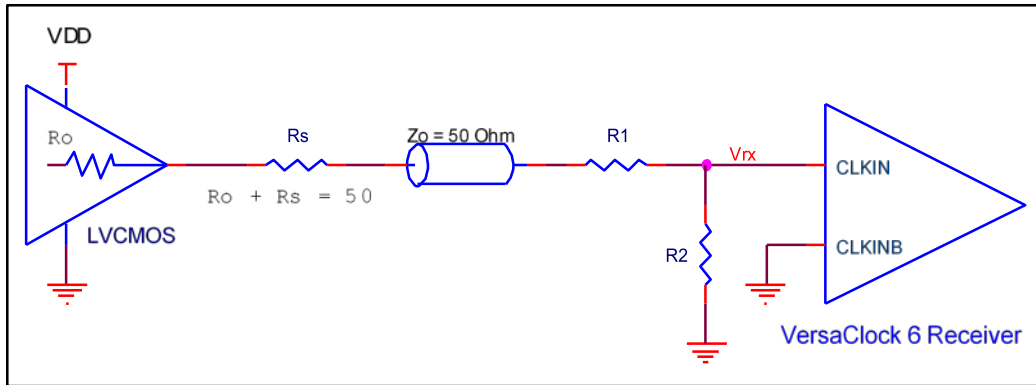

Table 21 shows resistor values that ensure the maximum drive level for the CLKIN port is not exceeded for all combinations of 5% tolerance on the driver V_{DD}, V_{DDO0} and 5% resistor tolerances. The values of the resistors can be adjusted to reduce the loading for slower and weaker LVCMOS driver by increasing the impedance of the R1–R2 divider. To better assist this assessment, the total load (Ro+Rs+R1+R2) on the driver is included in the table.

Table 21. Nominal Voltage Divider Values for Overdriving CLKIN with Single-Ended Driver

LVCMOS Diver V_{DD}	Ro + Rs	R1	R2	Vrx (peak)	Ro+Rs+R1+R2
3.3	50.0	130	75	0.97	255
2.5	50.0	100	100	1.00	250
1.8	50.0	62	130	0.97	242

11.1.2 Driving CLKIN with Differential Clock

CLKIN/CLKINB will accept DC coupled HCSL/LVPECL/LVDS signals.

VersaClock 6 Receiver
11.2 Output – Single-ended or Differential Clock Terminations

11.2.1 LVDS Termination

For a general LVDS interface, the recommended value for the termination impedance (ZT) is between 90Ω and 132Ω. The actual value should be selected to match the differential impedance (Zo) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω. Differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. The standard termination schematic as shown in figure *Standard Termination* or the termination of figure *Optional Termination* can be used, which uses a center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the IDT LVDS output.

If using a non-standard termination, it is recommended to contact IDT and confirm that the termination will function as intended. For example, the LVDS outputs cannot be AC coupled by placing capacitors between the LVDS outputs and the 100Ω shunt load. If AC coupling is required, the coupling caps must be placed between the 100Ω shunt termination and the receiver. In this manner the termination of the LVDS output remains DC coupled.

Figure 12. Standard and Optional Terminations
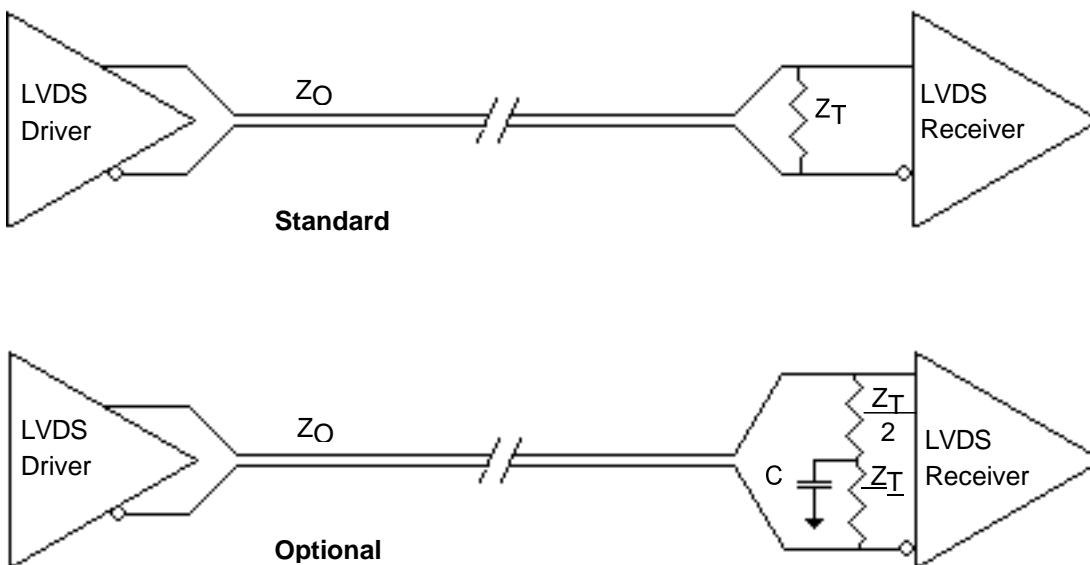

11.2.2 LVPECL Termination

The clock layout topology shown below are typical terminations for LVPECL outputs. The differential outputs generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. For VDDO = 2.5V, the VDDO – 2V is very close to ground level. The R3 in 2.5V LVPECL Output Termination can be eliminated and the termination is shown in 2.5V LVPECL Output Termination (2).

Figure 13. 3.3V LVPECL Output Termination

11.2.3 HCSL Termination

HCSL termination scheme applies to both 3.3V and 2.5V VDDO.

Figure 18. HCSL Receiver Terminated
Figure 19. HCSL Source Terminated
11.2.4 LVCMOS Termination

Each output pair can be configured as a standalone CMOS or dual-CMOS output driver. An example of CMOSD driver termination is shown in the following figure:

- CMOS1 – Single CMOS active on OUTx pin
- CMOS2 – Single CMOS active on OUTxB pin
- CMOSD – Dual CMOS outputs active on both OUTx and OUTxB pins, 180 degrees out of phase
- CMOSX2 – Dual CMOS outputs active on both OUTx and OUTxB pins, in-phase.

5P49V6975A000LTGI8	4 × 4 mm 24-LGA	Tape and Reel	-40° to +85°C

1. "ddd" denotes factory programmed configurations based on required settings. Please contact factory for factory programming.
2. "000" denotes un-programmed parts for user customization.

15. Revision History

Revision Date	Description of Change
April 27, 2018	Updated Supply Voltage, Current Consumption and AC Timing Characteristics electrical tables.
March 15, 2018	Updated Current Consumption, AC Timing, LVDS, and CMOS electrical tables.
February 15, 2018	Updated package outline drawings.
January 31, 2018	Updated ordering information package code designator from NLG to LTG.
January 10, 2018	Initial release.
