## 4-bit binary full adder with fast carry

## 74HC/HCT283

## FEATURES

- High-speed 4-bit binary addition
- Cascadable in 4-bit increments
- Fast internal look-ahead carry
- Output capability: standard
- I<sub>CC</sub> category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT283 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT283 add two 4-bit binary words (A<sub>n</sub> plus B<sub>n</sub>) plus the incoming carry. The binary sum appears on the sum outputs (Σ<sub>1</sub> to Σ<sub>4</sub>) and the out-going carry (C<sub>OUT</sub>) according to the equation:

$$C_{IN} + (A_1 + B_1) + 2(A_2 + B_2) + 4(A_3 + B_3) + 8(A_4 + B_4) = \Sigma_1 + 2\Sigma_2 + 4\Sigma_3 + 8\Sigma_4 + 16C_{OUT}$$

Where (+) = plus.

Due to the symmetry of the binary add function, the "283" can be used with either all active HIGH operands (positive logic) or all active LOW operands (negative logic); see function table. In case of all active LOW operands the results Σ<sub>1</sub> to Σ<sub>4</sub> and C<sub>OUT</sub> should be interpreted also as active LOW. With active HIGH inputs, C<sub>IN</sub> must be held LOW when no "carry in" is intended. Interchanging inputs of equal weight does not affect the operation, thus C<sub>IN</sub>, A<sub>1</sub>, B<sub>1</sub> can be assigned arbitrarily to pins 5, 6, 7, etc.

See the "583" for the BCD version.

## QUICK REFERENCE DATA

GND = 0 V; T<sub>amb</sub> = 25 °C; t<sub>r</sub> = t<sub>f</sub> = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT

## Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

Σ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is V<sub>I</sub> = GND to V<sub>CC</sub>

For HCT the condition is V<sub>I</sub> = GND to V<sub>CC</sub> – 1.5 V

**Note to HCT types**

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
C <sub>IN</sub>	1.50
B <sub>2</sub> , A <sub>2</sub> , A <sub>1</sub>	1.00

### AC WAVEFORMS

### Notes to Figs 7 to 10

Figure 7 shows a 3-bit adder using the "283". Tying the operand inputs of the fourth adder ( $A_3$ ,  $B_3$ ) LOW makes  $\Sigma_3$  dependent on, and equal to, the carry from the third adder. Based on the same principle, Figure 8 shows a method of dividing the "283" into a 2-bit and 1-bit adder. The third stage adder ( $A_2$ ,  $B_2$ ,  $\Sigma_2$ ) is used simply as means of transferring the carry into the fourth stage (via  $A_2$  and  $B_2$ ) and transferring the carry from the second stage on  $\Sigma_2$ . Note that as long as  $A_2$  and  $B_2$  are the same, HIGH or LOW, they do not influence  $\Sigma_2$ . Similarly, when  $A_2$  and  $B_2$  are the same, the carry into the third stage does not influence the carry out of the third stage. Figure 9 shows a method of implementing a 5-input encoder, where the

### APPLICATION INFORMATION

inputs are equally weighted. The outputs  $\Sigma_0$ ,  $\Sigma_1$  and  $\Sigma_2$  produce a binary number equal to the number inputs ( $I_1$  to  $I_5$ ) that are HIGH. Figure 10 shows a method of implementing a 5-input majority gate. When three or more inputs ( $I_1$  to  $I_5$ ) are HIGH, the output  $M_5$  is HIGH.
