# DM54L74 Dual Positive-Edge-Triggered D Flip-Flops with Preset, Clear, and Complementary Outputs

## **General Description**

This device contains two independent positive-edge-triggered D flip-flops with complementary outputs. The information on the D input is accepted by the flip-flops on the positive going edge of the clock pulse. The triggering occurs at a voltage level and is not directly related to the transition time of the rising edge of the clock. The data on the D input

may be changed while the clock is low or high without affecting the outputs as long as the data setup and hold times are not violated. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

#### **Function Table**

Inputs			Outputs		
PR	CLR	CLK	D	Q	Q
L	Н	х	×	Н	L
н	L	х	×	L	Н
L	L	Х	X	H*	H*
Н	н	↑	H	н	L
н	н	1 ↑	L	L	Н
н	Н	L	×	QO	$\overline{Q}_O$

- H = High Logic Level
- X = Either Low or High Logic Level
- L = Low Logic Level
- 1 = Positive-going transition.
- $\mathbf{Q}_{O}=$  The output logic level of  $\mathbf{Q}$  before the indicated input conditions were established.
- This configuration is nonstable; that is, it will not persist when either the preset and/or clear inputs returned to their inactive (high) level.

# Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage 8V Input Voltage 5.5V

Operating Free Air Temperature Range

DM54L -55°C to +125°C

Storage Temperature Range -65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
