

General Description

The 839051 is a low skew, 1-to-6 LVCMOS / LVTTTL Fanout Buffer. The low impedance LVCMOS/LVTTTL outputs are designed to drive 50Ω series or parallel terminated transmission lines. The effective fanout can be increased from 6 to 12 by utilizing the ability of the outputs to drive two series terminated lines.

The 839051 is characterized at full 3.3V, 2.5V, and 1.8V, mixed 3.3V/2.5V, 3.3V/1.8V and 2.5V/1.8V output operating supply modes. Guaranteed output and part-to-part skew characteristics along with the 1.8V output capabilities makes the 839051 ideal for high performance, single ended applications that also require a limited output voltage.

Features

- Six LVCMOS / LVTTTL outputs
- Outputs able to drive 12 series terminated lines
- Crystal Oscillator Interface
- Crystal input frequency range: 10MHz to 40MHz
- Output skew: 80ps (maximum)
- RMS phase jitter @ 25MHz, (100Hz – 1MHz): 0.26ps (typical), $V_{DD} = V_{DDO} = 2.5V$

Offset	Noise Power
100Hz.....	-129.7 dBc/Hz
1kHz.....	-144.4 dBc/Hz
10kHz.....	-147.3 dBc/Hz
100kHz.....	-157.3 dBc/Hz

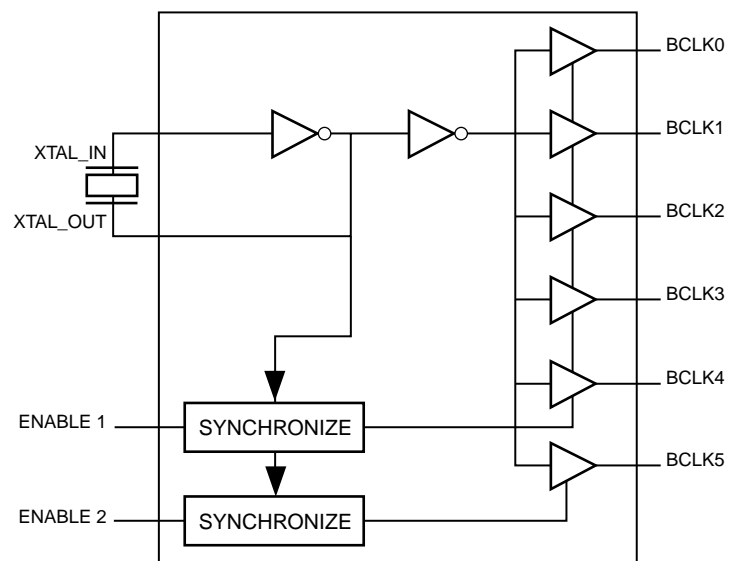

- 5V tolerant enable inputs
- Synchronous output enables
- Operating power supply modes:
Full 3.3V, 2.5V, 1.8V
Mixed 3.3V core/2.5V output operating supply
Mixed 3.3V core/1.8V output operating supply
Mixed 2.5V core/1.8V output operating supply
- -40°C to 85°C ambient operating temperature
- Lead-free (RoHS 6) packaging

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_O	-0.5V to $V_{DDO} + 0.5V$
Package Thermal Impedance, θ_{JA} 16-Lead TSSOP package	89°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Applications Information

LVC MOS to XTAL Interface

The XTAL_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 2*. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output impedance of the driver (R_o) plus the series resistance (R_s) equals

the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50Ω applications, R_1 and R_2 can be 100Ω . This can also be accomplished by removing R_1 and making R_2 50Ω . By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.

Figure 2. General Diagram for LVC MOS Driver to XTAL Input Interface

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 3*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are

application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 3. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Recommendations for Unused Input and Output Pins

Inputs:

LVC MOS Control Pins

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs:

LVC MOS Outputs

All unused LVC MOS output can be left floating. There should be no trace attached.

Layout Guideline

Figure 4 shows an example of 839051 application schematic. The schematic example focuses on functional connections and is not configuration specific. In this example, the device is operated at $V_{DD} = 3.3V$ and $V_{DDO} = 1.8V$. The crystal inputs are loaded with an 18pf load resonant quartz crystal. The tuning capacitors (C1, C2) are fairly accurate, but minor adjustments might be required. Refer to the pin description and functional tables in the datasheet to ensure the logic control inputs are properly set. For the LVCMOS output drivers, two termination examples are shown in the schematic. For additional termination examples are shown in the LVCMOS Termination Application Note.

As with any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 839051 provides separate V_{DD} and V_{DDO} power supplies to isolate any high switching noise from coupling into the internal oscillator. In order to achieve the best possible filtering, it is highly

recommended that the 0.1uF capacitors on the device side of the ferrite beads be placed on the device side of the PCB as close to the power pins as possible. This is represented by the placement of these capacitors in the schematic. If space is limited, the ferrite beads, 10uF and 0.1uF capacitor connected to the board supplies can be placed on the opposite side of the PCB. If space permits, place all filter components on the device side of the board.

Power supply filter recommendations are a general guideline to be used for reducing external noise from coupling into the devices. The filter performance is designed for a wide range of noise frequencies. This low-pass filter starts to attenuate noise at approximately 0kHz. If a specific frequency noise component is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally, good general design practices for power plane voltage stability suggests adding bulk capacitance in the local area of all devices.

Figure 4. Schematic of Recommended Layout

Power Considerations

This section provides information on power dissipation and junction temperature for the 83905I. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 83905I is the sum of the core power plus the analog power plus the power dissipated due to the load. The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * (I_{DD} + I_{DDO}) = 3.465V * (10mA + 5mA) = \mathbf{51.9mW}$
- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$
Output Current $I_{OUT} = V_{DD_MAX} / [2 * (50\Omega + R_{OUT})] = 3.465V / [2 * (50\Omega + 7\Omega)] = \mathbf{30.4mA}$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 7\Omega * (30.4mA)^2 = \mathbf{6.5mW}$ per output
- Total Power Dissipation on the R_{OUT}
Total Power (R_{OUT}) = $6.5mW * 6 = \mathbf{39mW}$

Dynamic Power Dissipation at 25MHz

$$\text{Power (25MHz)} = C_{PD} * \text{Frequency} * (V_{DD})^2 = 19pF * 25MHz * (3.465V)^2 = \mathbf{5.70mW}$$
 per output
Total Power (25MHz) = $5.70mW * 6 = \mathbf{34.2mW}$

Total Power Dissipation

- **Total Power**
= Power (core)_{MAX} + Total Power (R_{OUT}) + Total Power (25MHz)
= $51.98mW + 39mW + 34.2mW$
= **125.1mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C .

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_{total} + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 89°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.125W * 89^\circ\text{C/W} = 96.1^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 16-Lead TSSOP, Forced Convection

Linear Feet per Minute	θ_{JA} by Velocity		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	137.1°C/W	118.2°C/W	106.8°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	89.0°C/W	81.8°C/W	78.1°C/W

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

Reliability Information

Table 8. θ_{JA} vs. Air Flow Table for a 16-Lead TSSOP

θ_{JA} vs. Air Flow			
Linear Feet per Minute	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	137.1°C/W	118.2°C/W	106.8°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	89.0°C/W	81.8°C/W	78.1°C/W

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

Transistor Count

The transistor count for 83905I: 339

Package Outline and Package Dimensions

Package Outline - G Suffix for 16-Lead TSSOP

Table 9. Package Dimensions for 16-Lead TSSOP

All Dimensions in Millimeters		
Symbol	Minimum	Maximum
N	16	
A		1.20
A1	0.05	0.15
A2	0.80	1.05
b	0.19	0.30
c	0.09	0.20
D	4.90	5.10
E	6.40 Basic	
E1	4.30	4.50
e	0.65 Basic	
L	0.45	0.75
alpha	0°	8°
aaa		0.10

Ordering Information

Table 10. Ordering Information

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
83905AGILF	83905AIL	16-Lead TSSOP, Lead-Free	Tube	-40°C to 85°C
83905AGILFT	83905AIL	16-Lead TSSOP, Lead-Free	Tape & Reel	-40°C to 85°C

Revision History Sheet

Rev	Table	Page	Description of Change	Date
A		2	Added Enable Timing Diagram.	3/28/05
B	T6A - T6F	1 5 - 7 8	Features Section - added RMS Phase Jitter bullet. AC Characteristics Tables - added RMS Phase Jitter specs. Corrected ambient operating temperature Added Phase Noise Plot.	4/8/05
B		11 12	Added Crystal Input Interface in Application Section. Added Schematic layout.	5/16/05
B	T9	15	Ordering Information - removed leaded parts. Removed ICS from ordering part number. Removed 2500 on tape and reel shipping information. Removed lead free note.	12/3/15
C		3 13 13 14 14 15 16	Corrected Figure 1, Enable Timing Diagram. Applications Information Section: Deleted <i>Crystal Input Interface</i> application note, see Layout Guideline Added <i>LVC MOS to XTAL Interface</i> application note Added <i>VFQFN EPAD Thermal Release Path</i> application note Added <i>Recommendations for Unused Input and Output Pins</i> application note Updated <i>Layout Guideline</i> , adding crystal interface Added <i>Power Considerations</i> section. Updated datasheet header/footer and format.	9/28/16
