LINEAR INTEGRATED CIRCUIT

VOLTAGE DETECTING, SYSTEM RESETTING IC

DESCRIPTION

UTC **86N1C**, which has the feature of setting the detection voltage by adding external resistance is semiconductor integrated circuit for resetting of all types of logic circuits such as CPUs.

It includes a built-in delay circuit to get the desired retardation time simply by adding an external capacitor.

It is well-suited to extensive applications, including battery checking circuit, waveform shaping circuit and level detecting circuit.

FEATURES

- * Few external parts
- * Low threshold operating voltage (Supply voltage to keep low-state at low supply voltage): 0.6V (Typ.) at $R_L=22k\Omega$
- * Large delay time with a capacitor of small capacitance
- * Wide application range
- * Wide supply voltage range: 2V~17V
- * Open-Drain RESET Active Low Output

■ TYPICAL APPLICATION CIRCUIT

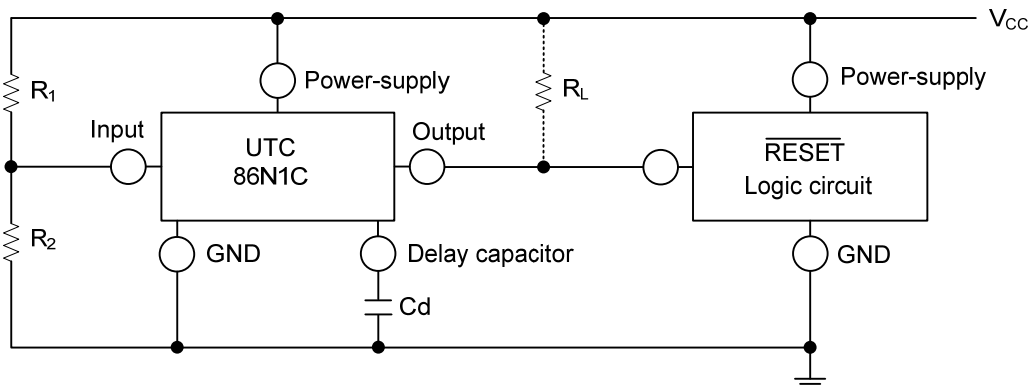

Figure 1 Reset Circuit of UTC 86N1C

- Notes:
1. The detecting supply voltage is $V_S \times (R_1 + R_2)/R_2$ (V) approximately. $V_S=1.25V$ (Typ)
The detecting supply voltage can be set between 2V and 15V.
 2. The delay time is about $0.38 \times C_d$ (pF) μs .
 3. The logic circuit preferably should not have a pull-down resistor, but if one is present, add load resistor R_L to overcome the pull-down resistor.
 4. When a negative supply voltage is used, the supply voltage side of UTC **86N1C** and the GND side are connected to negative supply voltage respectively.

Note: 1. When UTC 86N1C are used, a waveform with a large delay time can generate only by adding a small capacitor.
