

PRODUCT DISCONTINUATION NOTICE - LAST TIME BUY EXPIRES MAY 6, 2017

General Description

The 87973I-147 is a LVCMOS/LVTTTL clock generator. The 87973I-147 has three selectable inputs and provides 14 LVCMOS/LVTTTL outputs.

The 87973I-147 is a highly flexible device. The three selectable inputs (1 differential and 2 single ended inputs) are often used in systems requiring redundant clock sources. Up to three different output frequencies can be generated among the three output banks.

The three output banks and feedback output each have their own output dividers which allows the device to generate a multitude of different bank frequency ratios and output-to-input frequency ratios. In addition, 2 outputs in Bank C (QC2, QC3) can be selected to be inverting or non-inverting. The output frequency range is 10MHz to 150MHz. The input frequency range is 6MHz to 120MHz.

The 87973I-147 also has a QSYNC output which can be used for system synchronization purposes. It monitors Bank A and Bank C outputs and goes low one period prior to coincident rising edges of Bank A and Bank C clocks. QSYNC then goes high again when the coincident rising edges of Bank A and Bank C occur. This feature is used primarily in applications where Bank A and Bank C are running at different frequencies, and is particularly useful when they are running at non-integer multiples of one another.

Example Applications:

1. *System Clock generator:* Use a 16.66MHz reference clock to generate eight 33.33MHz copies for PCI and four 100MHz copies for the CPU or PCI-X.
2. *Line Card Multiplier:* Multiply differential 62.5MHz from a back plane to single-ended 125MHz for the line Card ASICs and Gigabit Ethernet Serdes.
3. *Zero Delay buffer for Synchronous memory:* Fanout up to twelve 100MHz copies from a memory controller reference clock to the memory chips on a memory module with zero delay.

Features

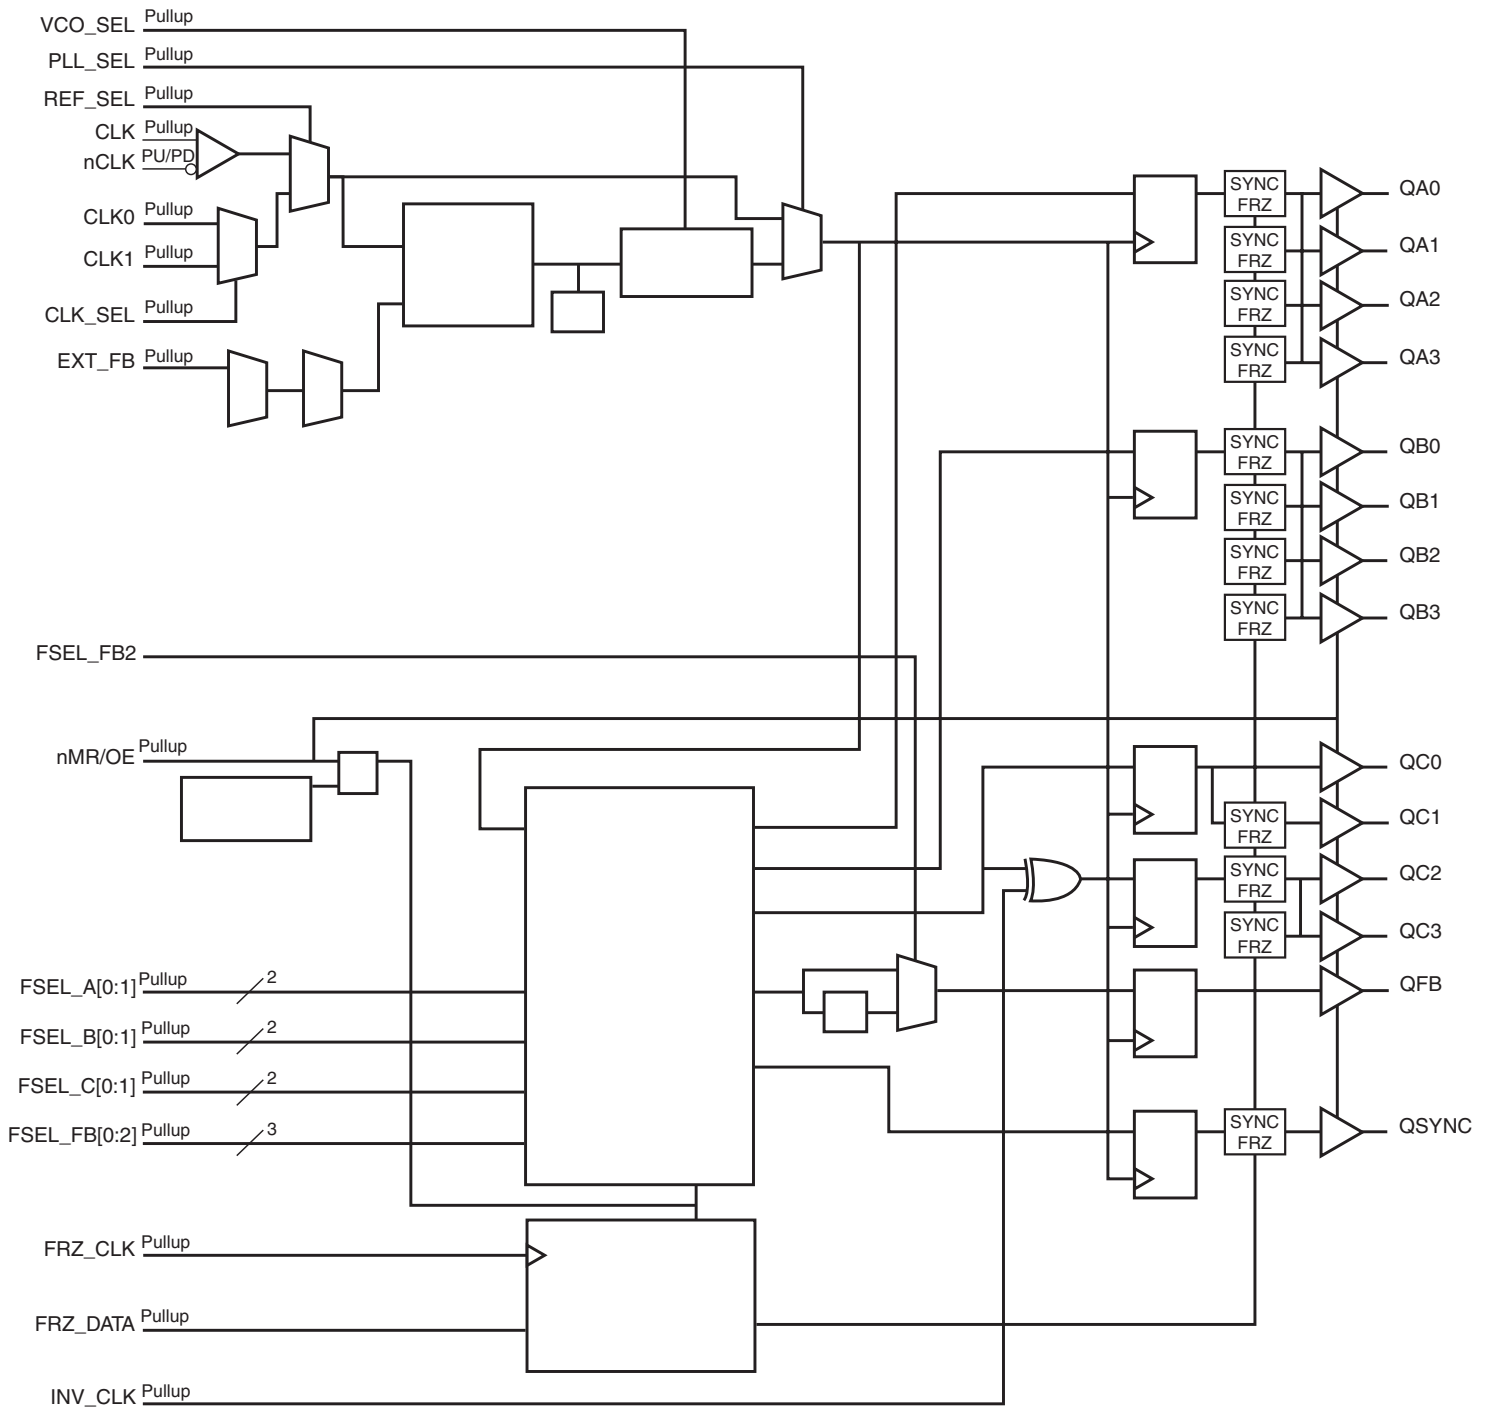

- Fully integrated PLL
- Fourteen LVCMOS/LVTTTL outputs to include: twelve clocks, one feedback, one sync
- Selectable differential CLK, nCLK inputs or LVCMOS/LVTTTL reference clock inputs
- CLK0, CLK1 can accept the following input levels: LVCMOS or LVTTTL
- CLK, nCLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Output frequency range: 10MHz to 150MHz
- VCO range: 240MHz to 500MHz
- Output skew: 200ps (maximum)
- Cycle-to-cycle jitter, (all banks ± 4): 55ps (maximum)
- Full 3.3V supply voltage
- -40°C to 85°C ambient operating temperature
- Compatible with PowerPC™ and Pentium™ Microprocessors
- Available in lead-free packages
- **For drop-in replacement use 87973i**

Pin Descriptions and Pin Characteristic Tables

Table 1. Pin Descriptions

Number	Name	Type		Description
1	GNDI	Power		Power supply ground.
2	nMR/OE	Input	Pullup	Master reset and output enable. When HIGH, enables the outputs. When LOW, resets the outputs in a high-impedance state and resets output divide circuitry. Enables and disables all outputs. LVCMOS / LVTTTL interface levels.
3	FRZ_CLK	Input	Pullup	Clock input for freeze circuitry. LVCMOS / LVTTTL interface levels.
4	FRZ_DATA	Input	Pullup	Configuration data input for freeze circuitry. LVCMOS / LVTTTL interface levels.
5, 26, 27	FSEL_FB2, FSEL_FB1, FSEL_FB0	Input	Pullup	Select pins control Feedback Divide value. LVCMOS / LVTTTL interface levels. See Table 3B.
6	PLL_SEL	Input	Pullup	Selects between the PLL and reference clocks as the input to the output dividers. When HIGH, selects PLL. When LOW, bypasses the PLL and reference clocks. LVCMOS / LVTTTL interface levels.
7	REF_SEL	Input	Pullup	Selects between CLK0 or CLK1 and CLK, nCLK inputs. When LOW, selects CLK0 or CLK1. When HIGH, CLK, nCLK inputs. LVCMOS / LVTTTL interface levels.
8	CLK_SEL	Input	Pullup	Clock select input. When LOW, selects CLK0. When HIGH, selects CLK1. LVCMOS / LVTTTL interface levels.
9, 10	CLK0, CLK1	Input	Pullup	Single-ended reference clock inputs. LVCMOS/LVTTTL interface levels.
11	CLK	Input	Pullup	Non-inverting differential clock input.
12	nCLK	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{DD}/2$ default when left floating.
13	V_{DDA}	Power		Analog supply pin.
14	INV_CLK	Input	Pullup	Inverted clock select for QC2 and QC3 outputs. LVCMOS / LVTTTL interface levels.
15, 24, 30, 35, 39, 47, 51	GND0	Power		Power supply ground.
16, 18, 21, 23	QC3, QC2, QC1, QC0	Output		Single-ended Bank C clock outputs. LVCMOS/ LVTTTL interface levels.
17, 22, 33, 37, 45, 49	V_{DDO}	Power		Output power supply pins.
19, 20	FSEL_C1, FSEL_C0	Input	Pullup	Select pins for Bank C outputs. LVCMOS / LVTTTL interface levels. See Table 3A.
25	QYSNC	Output		Synchronization output for Bank A and Bank C. Refer to Figure 1, Timing Diagrams. LVCMOS / LVTTTL interface levels.
28	V_{DD}	Power		Power supply pin.
29	QFB	Output		Single-ended feedback clock output. LVCMOS / LVTTTL interface levels.
31	EXT_FB	Input	Pullup	External feedback. LVCMOS / LVTTTL interface levels.
32, 34, 36, 38	QB3, QB2, QB1, QB0	Output		Single-ended Bank B clock outputs. LVCMOS/ LVTTTL interface levels.
40, 41	FSEL_B1, FSEL_B0	Input	Pullup	Select pins for Bank B outputs. LVCMOS / LVTTTL interface levels. See Table 3A.
42, 43	FSEL_A1, FSEL_A0	Input	Pullup	Select pins for Bank A outputs. LVCMOS / LVTTTL interface levels. See Table 3A.
44, 46, 48, 50	QA3, QA2, QA1, QA0	Output		Single-ended Bank A clock outputs. LVCMOS/ LVTTTL interface levels.
52	VCO_SEL	Input	Pullup	Selects VCO. When HIGH, selects $VCO \div 1$. When LOW, selects $VCO \div 2$. LVCMOS / LVTTTL interface levels.

NOTE: Pullup refers to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_O	-0.5V to $V_{DDO} + 0.5V$
Package Thermal Impedance, θ_{JA}	42.3°C/W (0 lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = V_{DDA} = V_{DDO} = 3.3V \pm 5\%$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{DD}	Core Supply Voltage		3.135	3.3	3.465	V
V_{DDA}	Analog Supply Voltage		3.135	3.3	3.465	V
V_{DDO}	Output Supply Voltage		3.135	3.3	3.465	V
I_{DD}	Power Supply Current				225	mA
I_{DDA}	Analog Supply Current				20	mA

Table 4B. DC Characteristics, $V_{DD} = V_{DDA} = V_{DDO} = 3.3V \pm 5\%$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{IH}	Input High Voltage		2		$V_{DD} + 0.3$	V
V_{IL}	Input Low Voltage		-0.3		0.8	V
I_{IN}	Input Current				± 120	μA
V_{OH}	Output High Voltage; NOTE 1	$I_{OH} = -20mA$	2.4			V
V_{OL}	Output Low Voltage; NOTE 1	$I_{OL} = 20mA$			0.5	V
V_{PP}	Peak-to-Peak Input Voltage; NOTE 2, 3	CLK, nCLK	0.3		1	V
V_{CMRP}	Common Mode Input Voltage; NOTE 2, 3	CLK, nCLK	$V_{DD} - 2$		$V_{DD} - 0.6$	V

NOTE 1: Outputs terminated with 50Ω to $V_{DDO}/2$. See Parameter Measurement Information section. *Load Test Circuit diagram*.

NOTE 2: V_{IL} should not be less than -0.3V.

NOTE 3: Common mode input voltage is defined as V_{IH} .

Table 5. Input Frequency Characteristics, $V_{DD} = V_{DDA} = V_{DDO} = 3.3V \pm 5\%$, $T_A = -40^\circ\text{C}$ to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
F_{IN}	Input Frequency	CLK0, CLK1; NOTE 1			120	MHz
		FRZ_CLK			20	MHz

NOTE 1: Input frequency depends on the feedback divide ratio to ensure "clock * feedback divide" is in the VCO range of 240MHz to 500MHz.

AC Electrical Characteristics

Table 6. AC Characteristics, $V_{DD} = V_{DDA} = V_{DDO} = 3.3V \pm 5\%$, $T_A = -40^\circ\text{C}$ to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units	
f_{OUT}	Output Frequency	$\div 2$			250	MHz	
		$\div 4$			125	MHz	
		$\div 6$			83.33	MHz	
		$\div 8$			62.5	MHz	
		$\div 10$			50	MHz	
		$\div 12$			41.66	MHz	
$t(\emptyset)$	Static Phase Offset; NOTE 1	CLK0	QFB $\div 8$, In Frequency = 50MHz	-10	145	300	ps
		CLK1		-65	90	245	ps
		CLK, nCLK		-130	18	165	ps
$t_{sk(o)}$	Output Skew; NOTE 2, 3				200	ps	
$t_{jit(cc)}$	Cycle-to-Cycle Jitter; NOTE 3	All Banks $\div 4$			55	ps	
f_{VCO}	PLL VCO Lock Range		240		500	MHz	
t_{LOCK}	PLL Lock Time; NOTE 4				10	ms	
t_R / t_F	Output Rise/Fall Time	0.8V to 2V	150		700	ps	
odc	Output Duty Cycle		45		55	%	
t_{PZL}, t_{PZH}	Output Enable Time; NOTE 4				10	ns	
t_{PLZL}, t_{PHZ}	Output Disable Time; NOTE 4				8	ns	

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as the time difference between the input reference clock and the average feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at $V_{DDO}/2$.

NOTE 3: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 4: These parameters are guaranteed by characterization. Not tested in production.

Application Information

Recommendations for Unused Input and Output Pins

Inputs:

CLK/nCLK Inputs

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from CLK to ground.

CLK Inputs

For applications not requiring the use of the clock input, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the CLK to ground.

LVC MOS Control Pins

All control pins have internal pull-ups; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs:

LVC MOS Outputs

All unused LVC MOS output can be left floating. There should be no trace attached.

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 879731-147 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} , V_{DDA} and V_{DDO} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 2* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{DDA} pin.

Figure 2. Power Supply Filtering

Wiring the Differential Input to Accept Single-Ended Levels

Figure 3 shows how a differential input can be wired to accept single ended levels. The reference voltage $V_1 = V_{DD}/2$ is generated by the bias resistors $R1$ and $R2$. The bypass capacitor ($C1$) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of $R1$ and $R2$ might need to be adjusted to position the V_1 in the center of the input voltage swing. For example, if the input clock swing is 2.5V and $V_{DD} = 3.3\text{V}$, $R1$ and $R2$ value should be adjusted to set V_1 at 1.25V . The values below are for when both the single ended swing and V_{DD} are at the same voltage. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, $R3$ and $R4$ in parallel should equal the transmission

line impedance. For most 50Ω applications, $R3$ and $R4$ can be 100Ω . The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V_{IL} cannot be less than -0.3V and V_{IH} cannot be more than $V_{DD} + 0.3\text{V}$. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

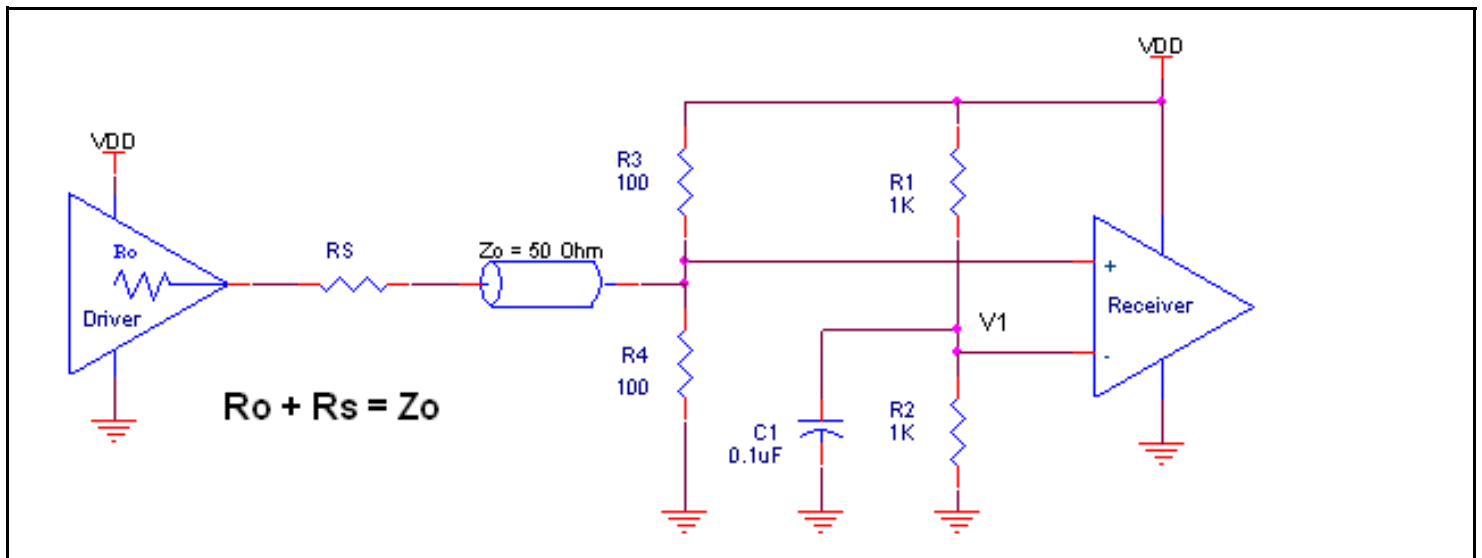

Figure 3. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

Differential Clock Input Interface

The CLK/nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. *Figures 4A to 4E* show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only.

Please consult with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 4A, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

Using the Output Freeze Circuitry

OVERVIEW

To enable low power states within a system, each output of 879731-147 (Except QC0 and QFB) can be individually frozen (stopped in the logic "0" state) using a simple serial interface to a 12 bit shift register. A serial interface was chosen to eliminate the need for each output to have its own Output Enable pin, which would dramatically increase pin count and package cost. Common sources in a system that can be used to drive the 879731-147 serial interface are FPGA's and ASICs.

PROTOCOL

The Serial interface consists of two pins, FRZ_Data (Freeze Data) and FRZ_CLK (Freeze Clock). Each of the outputs which can be frozen has its own freeze enable bit in the 12 bit shift register. The sequence is started by supplying a logic "0" start bit followed by 12NRZ freeze enable bits. The period of each FRZ_DATA bit equals the period of the FRZ_CLK signal. The FRZ_DATA serial transmission should be timed so the 879731-147 can sample each

FRZ_DATA bit with the rising edge of the FRZ_CLK signal. To place an output in the freeze state, a logic "0" must be written to the respective freeze enable bit in the shift register. To unfreeze an output, a logic "1" must be written to the respective freeze enable bit. Outputs will not become enabled/disabled until all 12 data bits are shifted into the shift register. When all 12 data bits are shifted in the register, the next rising edge of FRZ_CLK will enable or disable the outputs. If the bit that is following the 12th bit in the register is a logic "0", it is used for the start bit of the next cycle; otherwise, the device will wait and won't start the next cycle until it sees a logic "0" bit. Freezing and unfreezing of the output clock is synchronous (see the timing diagram below). When going into a frozen state, the output clock will go LOW at the time it would normally go LOW, and the freeze logic will keep the output low until unfrozen. Likewise, when coming out of the frozen state, the output will go HIGH only when it would normally go HIGH. This logic, therefore, prevents runt pulses when going into and out of the frozen state.

Figure 5A. Freeze Data Input Protocol

Figure 5. Output Disable Timing Diagram

Schematic Example

Figure 6 shows a schematic example of using 879731-147. This example shows general design of input, output termination, logic

control input pull up/down and power supply filtering. In this example, the clock input is driven by an LVCMOS driver.
