b. Timing diagram

Please refer to the attached drawing, from Fig.5 to Fig.8.

6. DC-DC Converter Circuit

A018AN03 V1 contains one high-power step-up DC-DC converter, and backplane drive circuitry for active matrix TFT LCDs. The output voltage of the main boost converter can be set from VCC to 13.5V with external resistors. Also included in A018AN03 V1 are a precision 1.2V reference voltage, fault detection and logic shutdown.

a .Boost Converter

A018AN03 V1 main boost converter uses a boost PWM architecture to produce a positive regulated voltage, Please refer to the below figures to see the block diagram.

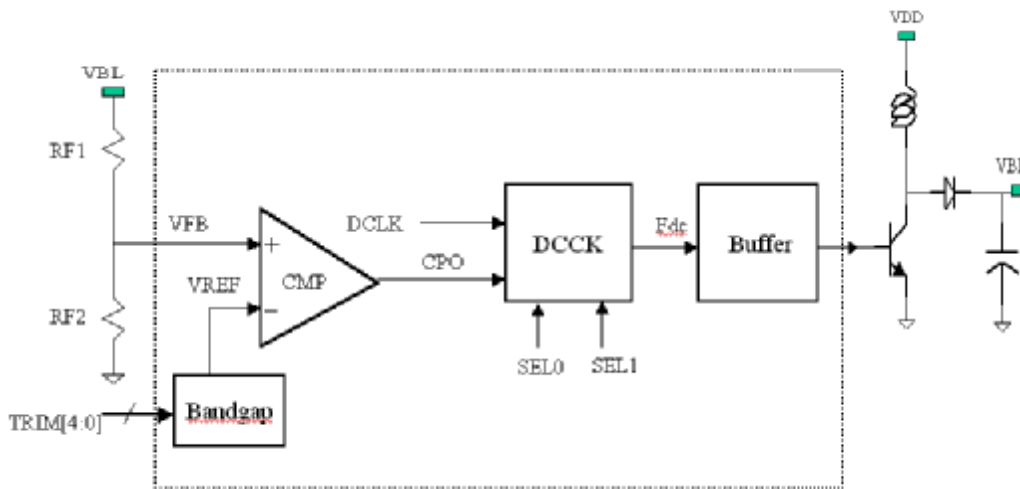

Fig 1 DC-DC converter block diagram

In the internal architecture of DC-DC converter. The feedback voltage(VFB) will connect to the tri-angle waveform comparator ,and generates the output signal (CP0) which determines the duty cycle for (Fdc).

Fig 2 DCCK block diagram

To reduce the noise affect,CP0 will processed by De-bounce circuit. State-machine will generate the duty cycle by CP0 signal. To make sure that VFB can reach default VREF quickly, so State-machine's is designed as a discrete step by step function. please refer to Fig 3. If CP0 is low , Duty cycle will work from 0% to 75%. The maximum duty ratio is 75%.

Fig 3 PWM Control state diagram

b.Shutdown Mode

In shutdown mode, a logic-low level on SHDB, pwm controller and the reference are disabled. The supply current drops to maximize battery life and the reference is pulled to ground. Every output voltage will decay. If unused, connect SHDB to VCC.

c.Oscillator Circuit

The boost-converter operating frequency was set at 1/16 times the system clock, DCLK. In A018AN03 V1's model. the DC-DC converter osc frequency is DCLK/16=354.4khz

Note 2. To be measured in the dark room.

Note 3. To be measured on the center area of panel with a field angle of 1° by Topcon luminance meter BM-7, after 10 minutes operation.

Note 4. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from “black” to “white”(falling time) and from “white” to “black”(rising time), respectively. The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 5. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Photo detector output when LCD is at "Black" state

Note 6. White $V_i = V_{i50} \mp 1.5V$

Black $V_i = V_{i50} \pm 2.0V$

"±" Means that the analog input signal swings in phase with COM signal.

"∓" Means that the analog input signal swings out of phase with COM signal.

V_{i50} : The analog input voltage when transmission is 50%

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle:, refer to figure as below.

Note 8. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.
