

#### **FEATURES AND BENEFITS**

- · Closed-loop speed control
- Speed curve configuration via EEPROM
- Programmable deceleration time
- I<sup>2</sup>C serial port
- Sinusoidal modulation for reduced audible noise and low vibration
- Sensorless (no Hall sensors required)
- Low R<sub>DS(ON)</sub> power MOSFETs—3 A capability
- Minimal external components
- · PWM speed input
- FG speed output
- RD rotor lock output
- Lock detection
- Soft start
- Standby mode
- · Shorted load protection

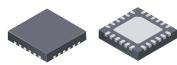

#### **DESCRIPTION**

The A5931-3 three-phase motor driver IC incorporates sensorless sinusoidal drive to minimize vibration for high speed server fans. Sensorless control eliminates the requirement for Hall sensors for server fan applications.

A flexible closed-loop speed control system is integrated into the IC. EEPROM is used to tailor the common functions of the fan speed curve to a specific application. This eliminates the requirement for a microprocessor-based system and minimizes programming requirements.

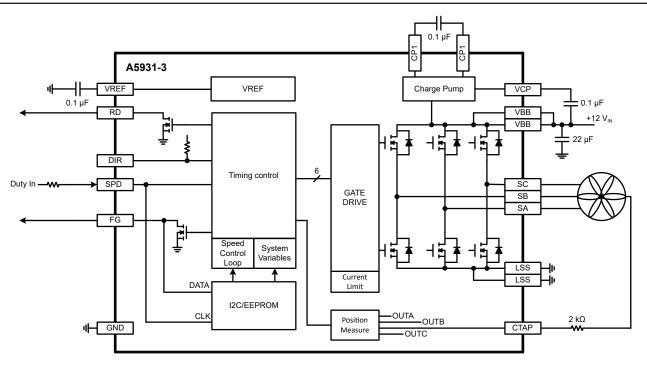

The A5931-3 is available in a 24-contact 4 mm  $\times$  4 mm QFN with exposed thermal pad (suffix ES). This packages are lead (Pb) free, with 100% matte-tin leadframe plating.

#### PACKAGE:

24-contact QFN with exposed thermal pad 4 mm × 4 mm × 0.75 mm (ES package)

Not to scale

**Figure 1: Typical Application** 

## **SPECIFICATIONS**

## **SELECTION GUIDE**

| Part Number    | Operating Temperature<br>Range (T <sub>A</sub> ) (°C) | Packaging                               | Packing                     |  |
|----------------|---|---|-----------------------------|--|
| A5931GESTR-3-T | -40 to 105  | 24-contact QFN with exposed thermal pad | 1500 pieces per 7-inch reel |  |

#### **ABSOLUTE MAXIMUM RATINGS**

| Characteristic              | haracteristic Symbol Notes |                        | Rating              | Unit |

<sup>[1]</sup> Specified limits are tested at a single temperature and assured over temperature range by design and characterization.

#### **FUNCTIONAL DESCRIPTION**

## **Basic Operation**

The A5931-3 targets high-speed fan applications to meet the objectives of minimal vibration, high efficiency, and ability to customize the IC to the speed control specification.

In typical systems, an MCU is required to meet each application specification. The A5931-3 integrates the basic closed-loop speed control function, thus allowing elimination of the cost, PCB space, and programming requirements of a custom MCU.

For each specific application, the EEPROM settings can be created with the Allegro EVB and software. Contact Allegro sales to order the custom IC. (Minimum volume requirements will apply).

The speed of the fan is controlled by variable duty cycle PWM input. The duty cycle is measured with system clock and converted to a 9-bit speed demand.

Protection features include lock detection with restart, overcurrent limit, motor output short circuit, supply undervoltage monitor, and thermal shutdown.

Standby mode can be achieved by holding SPD pin low for longer than the programmed lock off-time. In specific speed curve options, the motor will never turn off, if speed is set to run at a minimum value with 0% duty cycle applied. In this type of configuration, standby mode is not available.

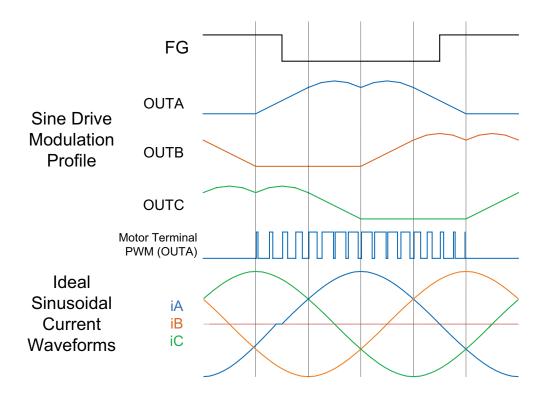

Figure 2: Sinusoidal Drive Sequence for DIR = HI

## Three-Phase Sensorless Fan Driver IC

**FG.** Open-drain output, represents the speed of the motor for normal operation. Additionally, the FG pin serves as the data line, (SDA) for I<sup>2</sup>C communication.

The FG output signal typically represents two periods per mechanical revolution.  $f_{FGOUT}$  may not be same as electrical frequency:

$$f_{ELEC} = f_{FGOUT} \times NumberOfPolePairs / 2$$
  
 $f_{FGOUT} = f_{ELEC} \times 2 / NumberOfPolePairs$   
 $RPM = 30 \times f_{FGOUT}$   
 $RPM = f_{ELEC} \times 60 / NumberOfPolePairs$ 

**RD.** Open-drain output, logic high indicates a rotor fault condition as defined by EEPROM variables. RD function can be disabled via EEPROM. When function is disabled, RD pin goes high to indicate end of open-loop starting sequence.

**SPD.** Speed Demand input pin. Only PWM mode is supported.

*PWM Duty cycle control*. The input Duty cycle is measured with logic circuit. The calculated output number is translated to a speed Demand signal with a resolution of 0.2%.

**CTAP.** This analog input is an optional connection for motor common (Wye motors). It is required to insert a  $2 \text{ k}\Omega$  resistor in series with the pin. If not used, as in case of Delta wound motor, then pin must be left open circuit.

**LOCK DETECT.** A5931-3 will turn off for the programmed time  $(t_{OFF})$  when the rotor is in a locked condition.

**DIR.** Logic input to control direction of motor. Logic "1" moves the outputs in sequence  $A \rightarrow B \rightarrow C$ . To reverse direction, logic "0" will sequence  $A \rightarrow C \rightarrow B$ . If the DIR pin changes while motor is running, the motor coasts for the programmed time,  $t_{LOCK}$ . After  $t_{LOCK}$  timeout, a normal startup sequence occurs. If motor is still moving opposite of intended direction, resynchronization logic will stop the motor before standard startup sequence.

DIR is pulled up internally with 100 k $\Omega$  resistor. To avoid any concern with PCB noise, it is recommended to connect pin to GND or VREF externally.

**OCP.** Overcurrent protection is intended to protect the IC from application conditions of shorted load, motor short to ground, and motor short to battery. The OCP protection monitors the drainto-source voltage (VDS) across any source or sink driver when the output is turned on. The OCP level is approximately 6.5 A. If the OCP threshold is exceeded for 640 nanoseconds, all drivers are shut off. This fault mode can be reset by PWM ON/OFF or timeout of t<sub>LOCK</sub>, depending on EEPROM bit OCPOPT.

Pin shorts to GND (low inductance) on PCB should be avoided. It is possible during startup that the applied duty can be set below the blank time of the OCP circuit. For this scenario, there can be multiple pulses of high current that may overstress the IC before the OCP shutdown can occur.

**OCL.** An optional overcurrent limit function can be set to four different levels via EEPROM. In general, current limit should be set to a value beyond the maximum expected run current. If current limit occurs during normal operation, audible noise or motor stalling could potentially be observed. The current limit circuit monitors the VDS of the sink-side MOSFET and turns off the source driver(s) for the remainder of the PWM cycle. Current limit needs to be enabled via EEROM bit OCLD set low. If enabled, then OCL bits in the EEPROM control the level as follows:

**Table 1: Overcurrent Limit** 

| Code | I <sub>OCL</sub> (A) |
|------|----------------------|
| 00   | 3.2                  |
| 01   | 2.6                  |
| 10   | 1.8                  |
| 11   | 1                    |

## **SPEED CURVE PARAMETERS**

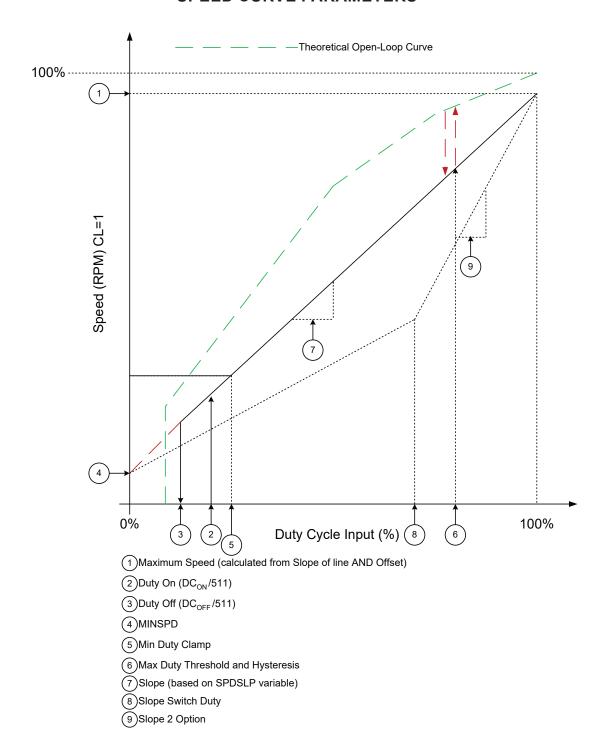

Figure 3: Speed Curve Parameters

## **Speed Curve Parameters (continued)**

Refer to "Figure 3: Speed Curve Parameters" on page 9 for items below.

**Minimum Speed Setpoint.** The minimum speed is defined by the value stored in EEPROM variable MINSPD. The resolution is 1 rpm.

MINSPD (rpm) = 0..4095

**Maximum Speed Setpoint.** The A5931-3 calculates the maximum speed based on line equation y = mx + B. The maximum speed is defined as the speed with input duty = 100%.

The desired maximum speed is used to set the EEPROM variable SPDSLP1.

 $SPDSLP1 = 64 \times (Maximum\ Speed\ (rpm) - MINSPD) / 511$ 

Example: Max Speed = 25000, Min Speed = 3000.

 $SPDSLP1 = 64 \times 22000 / 511 = 2755$ 

where SPDSLP1 = 0..8192

 $Motor\ Speed\ (rpm) = Slope\ \times\ DutyIN + MINSPD.$ 

where Slope = SPDSLP1  $\times$  511 / 64 and DutyIN expressed in %.

**Duty In Enable Threshold.** EEPROM variable DCON defines the input duty signal that enables the drive. DCON is an 8-bit number with resolution of 0.2%, which results in a maximum setting of 49.9%.

*Duty On (%)* =  $100 \times DCON / 511$ 

If DCON is set to "0", motor will turn on with 0% duty cycle input.

**Duty In Disable Threshold.** EEPROM variable DCOFF defines the input duty signal that disables the drive. DCOFF is an 8-bit number with resolution of 0.2%, which results in a maximum setting of 49.9%.

Duty Off(%) = DCOFF / 511

DCOFF should always be set to a lower number than DCON.

**Duty Cycle Invert.** To create mirror image of speed curve, set duty cycle invert bit to "1".

**Minimum Duty Clamp.** Minimum speed can be clamped to a value to allow motor to run at defined low-level speed. This is achieved by ignoring the duty cycle input if below the programmed MINDTY level.

Min Duty Clamp (%) = 100 × MINDTY / 511

Therefore, the minimum speed will be defined by:

 $MinSpeedClamp(rpm) = Slope \times MinDutyClamp + MINSPD$ 

Setting MINDTY to 0 disables the function.

MINDTY = 0..255.

**Maximum Duty Clamp.** EEPROM variable DTYMAX defines a duty level at which the motor will change operation from closed-loop curve. The change of operation would depend on MAXDTYOPT setting. If MAXDTYOP = 0, open-loop operation will result. If MAXDTYOPT = 1, then operation will remain closed-loop; however, the speed will be clamped at the value calculated by DTYMAX level.

4 bits are used for this setting at resolution of 1.6% to cover the range 76.5% to 100%.

Maximum Duty (%) =  $100 \times (511 - MAXDTY \times 8) / 511$ 

MAXDTY = 0..15; if MAXDTY = 0, then function is disabled.

Hysteresis is needed to prevent motor from going back and forth between open- and closed-loop mode.

MAXDTYHYS = 0...15.

 $Hys(\%) = (MAXDTYHYS + 1) \times 0.4$ 

**Dual Slope Option.** Two different slopes can be selected by setting variable SLPSWDTY greater than 0.

Slope2 = (MAXSPEED - SLPSWRPM) / (100% - SLPSWDTY)

Slope1 = (SLPSWRPM - MINSPEED) / SLPSWDTY

**Speed Feedback Clamp.** An EEPROM variable to adjust the deceleration time when switching from forced open back to close loop speed control. The smaller the clamp value the longer the deceleration time.

SpeedFeedBack Clamp (RPM) =  $code \times 8$  where code = 0 .. 255.

If code is less than 16, then by default it is set to 128.

## **RD FUNCTION**

Rotor lock output RD can be used to indicate motor is not running as expected. A high level on RD will indicate a fault.

Refer to the following four timing diagrams and Table 2 for understanding of the RD function and flexibility to adjust parameters via EEPROM.

Table 2

| EEPROM Parameter | Range       | Resolution       | Comment  |
|------------------|-------------|------------------|--|
| LOCKEVT          | 0/1         |                  | 0 = RD triggered at lock event count of 2<br>1 = Use RDBLANK for lock events |
| RDHIGH (rpm)     | 0 to 4080   | 16 rpm           | If set to 0; RD function disabled  |
| RDLOW (rpm)      | 0 to 4080   | 16 rpm           | Must be programmed lower than RD_high  |
| RDDLY            | 0 to 15     | 1 second         |  |
| RDBLANK          | 0.1 to 25.4 | 100 milliseconds |  |
| TLOCK            | 0.1 to 25.4 | 100 milliseconds |  |

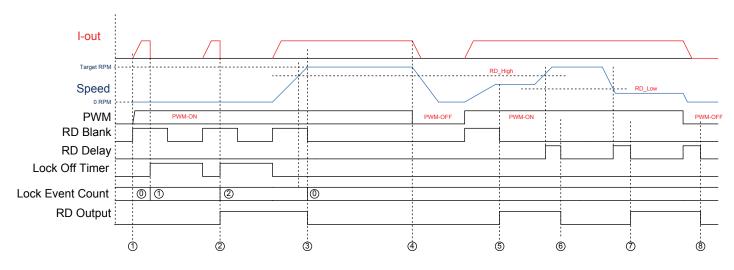

Figure 4: RD Timing Diagram (LOCKEVT = 0)

- 1. Power on with rotor locked condition
- 2. RD is high after 2nd lock event
- 3. RD resets low after RD Blank if Speed > RD\_High; Lock Event Count reset to zero
- 4. PWM off RD is low since normal condition
- 5. RD is high after RD Blank if Speed < RD High
- 6. RD is low if Speed > RD High after RD Delay
- 7. RD is high if Speed < RD\_Low after RD Delay
- 8. PWM off RD goes low after RD Delay low since normal condition

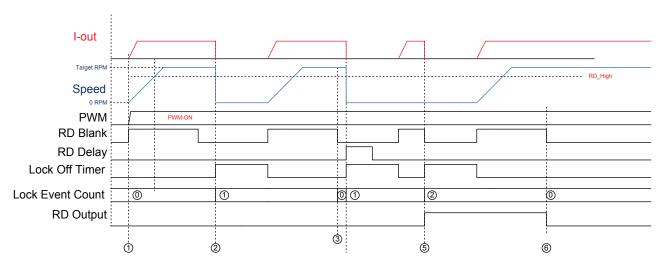

Figure 5: RD Timing Diagram (LOCKEVT = 0); lock condition while running

- 1. Power on with PWM normal startup
- 2. Rotor locked while running Lock Event Counter is one
- 3. If Speed > RD\_high after RD Blank, Lock Event count reset to zero
- 4. Rotor locked while running Lock Event Counter is one
- 5. RD is high after 2nd lock event
- 6. RD reset to low after RD Blank if (Speed > RD\_High); Lock Event Count reset to zero

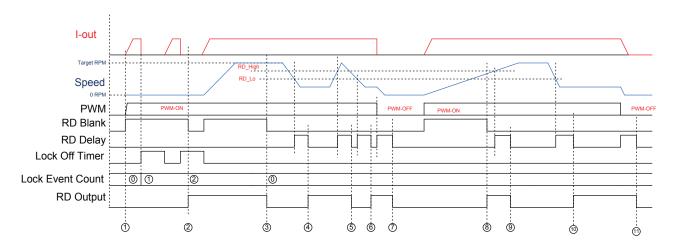

Figure 6: RD Timing Diagram (LOCKEVT = 1)

- 1. Power on with rotor locked condition
- 2. RD is high after RD Blank if Speed < RD High
- 3. RD resets low after RD Blank if Speed > RD High
- 4. RD changes to high if Speed < RD Low after RD Delay
- 5. RD changes to low if Speed > RD\_High after RD Delay
- 6. RD changes to high if Speed < RD Low after RD Delay
- 7. RD changes to low when PWM goes off after RD Delay
- 8. RD changes to high after RD Blank if Speed < RD High even if Speed > RD Low
- 9. RD changes to low if Speed > RD High after RD Delay
- 10. RD changes to high if Speed < RD Low after RD Delay
- 11. RD changes to low when PWM goes off after RD Delay

Note: RD Blank should be programmed longer than the time it takes to accelerate to the RD\_High level.

Startup time + time to accelerate to RD\_High.

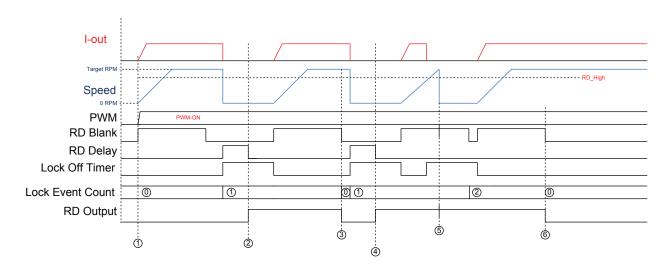

Figure 7: RD Timing Diagram (LOCKEVT = 1); lock condition while running

- 1. Power on with PWM normal startup
- 2. Rotor locked while running RD changes to high after RD Delay if Speed < RD Low
- 3. RD changes to low if Speed > RD\_high after RD Blank
- 4. Rotor locked while running RD changes to high after RD Delay if Speed < RD Low
- 5. RD remains high, even if Speed is OK, since RD Blank has not timed out
- 6. RD reset to low after RD Blank if Speed > RD\_High

## **EEPROM MAP**

Table 3: EEPROM Map

| ADDR | Bits  | Name      | Description                                  | Default Setting       | Default Value<br>(decimal) |

## Three-Phase Sensorless Fan Driver IC

## SERIAL PORT CONTROL OPTION

Normally the IC is controlled by duty cycle input and uses the EEPROM data that is stored to create the speed curve profile. However, it is possible to use direct serial port control to avoid programming EEPROM.

When using direct control, the input duty cycle command is replaced by writing a 9-bit number to register 165.

#### Example:

REGADDR[data]: (in decimal)

 $165[511] \rightarrow \text{Duty} = 100\%$ 

 $165[102] \rightarrow \text{Duty} = 102 / 511 = 20\%$ 

Upon power up, the IC defaults to duty cycle input mode. To use serial port mode, the internal registers should be programmed before turning the part on. The sequence to use serial port mode is:

- 1. Drive FG and SPD pins low\*
- 2. Power-up IC
- 3. Program registers for parameter setting that correspond to each of the EEPROM memory locations.
  - A. REGADDR = 64 + EEPROM ADDR.
  - B. Program register addresses 65 to 84 corresponding to EEPROM addresses 1 to 20.
  - C. It may be helpful to use the GUI text file to help define the hex data for each of the EEPROM addresses.
- 4. Write to register 165 to start motor
- \* Note: If SPD is not driven low before power up, motor will try to start immediately as the default high value will demand 100% on signal.

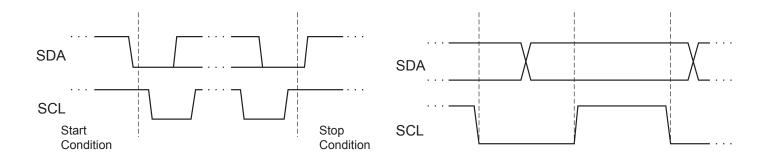

#### **Serial Port**

The A5931-3 uses standard fast mode I<sup>2</sup>C serial port format to program the EEPROM or to control the IC speed serially. The SPD pin functions as the clock (SCL) input, and the FG pin is the data line (SDA). No special sequence is needed to begin transferring data. If the motor is running, the FG may then pull the data line low while trying to initialize into serial port mode. Once an I<sup>2</sup>C command is sent, the SPD input is ignored, and the motor will turn off as if a PWM duty command of 0% was sent.

The A5931-3 7-bit slave address is 0x55.

## I<sup>2</sup>C Timing Diagrams

**Figure 8: Start and Stop Conditions**

## **Programming EEPROM**

The A5931-3 contains 24 words of 16-bit length. The EEPROM is controlled with the following I<sup>2</sup>C registers. Refer to application note for EEPROM definition.

#### Table 4: EEPROM Control – Register 161 (Used to control programming of EEPROM)

| 15 | <br>14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3  | 2  | 1  | 0  |
|----|--------|----|----|----|----|---|---|---|---|---|---|----|----|----|----|
| 0  | 0      | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | RD | WR | ER | EN |

| Bit  | Name | Description   |
|------|------|---|
| 0    | EN   | Set EEPROM voltage required for writing or erasing        |
| 1    | ER   | Sets mode to erase  |
| 2    | WR   | Sets mode to write  |
| 3    | RD   | Sets mode to read   |
| 15:4 | n/a  | Do not use; always set to zero during programming process |

#### Table 5: EEPROM Address - Register 162 (Used to set the EEPROM address to be altered)

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4         | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|---|---|---|---|---|-----------|---|---|---|---|
| 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | eeADDRESS |   |   |   |   |

|   | Bit  | Name Description |   |  |  |  |
|---|------|------------------|---|--|--|--|
| 4:0 eeADDRESS Used to specify EEPROM address to be changed. |      |                  |   |  |  |  |
|   | 15:5 | n/a              | Do not use; always set to zero during programming process |  |  |  |

#### Table 6: EEPROM DataIn - Register 163 (Used to set the EEPROM new data to be programmed)

| 15 | 14       | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
|    | eeDATAin |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| Bit  | Name     | Description                                       |
|------|----------|---|
| 15:0 | eeDATAin | Used to specify the new EEPROM data to be changed |

## Three-Phase Sensorless Fan Driver IC

## Table 7: DataOUT - Register 164 (Used for read operations)

| 15 | 14        | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|-----------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
|    | eeDATAout |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| Bit  | Name      | Description   |
|------|-----------|---|
| 15:0 | eeDATAout | Used to readback EEPROM data from address defined in register 162 |

There are 3 basic commands: Read, Erase, and Write. To change the contents of a memory location, the word must be first erased. The EEPROM programming process (writing or erasing) takes 10 ms per word.

Each word must be written individually.

Example #1: Write EEPROM address 5 to 261 (0x0105)

1) Erase the word

I<sup>2</sup>C Write REGADDR[Data] ; comment

a. 162[5] ; set EEPROM address to erase

b. 163[0] ; set 0000 as Data In

c. 161[3] ; set control to Erase and trigger high-voltage pulse

d. Wait 15 ms ; wait for pulse to end

e. 161[0] ; clear voltage

2) Write the new data

a. 162[5] ; set EEPROM address to write

b. 163[261] ; set Data In = 261

c. 161[5] ; set control to Write and trigger high-voltage pulse

d. Wait 15 ms ; wait for pulse to end

e. 161[5] ; clear voltage

Example #2: Read EEPROM address 5 to confirm correct data properly programmed

1) Read the word

a. 5[I<sup>2</sup>C Read] ; read register 5; this will be the contents of EEPROM

## **APPLICATION INFORMATION**

**Figure 13: Typical Application Circuit** 

**Table 8: Typical Application Components** 

| Name               | Suggested Value | Comment   |
|--------------------|-----------------|---|
| C <sub>VREF</sub>  | 0.1 μF/X5R/10 V | Ceramic capacitor required  |
| C <sub>VBB</sub>   | 10 to 100 μF    | Power supply stabilization – electrolytic or ceramic OK.  |
| C <sub>VCP</sub>   | 0.1 μF          | Ceramic capacitor required  |
| C <sub>CP</sub>    | 0.1 μF          | Ceramic capacitor required  |
| D1                 | Not installed   | May be required to isolate motor from system or for reverse polarity protection   |
| ZD1                | SMBJ14A         | TVS to limit max V <sub>BB</sub> due to transients due to motor generation on power line. Suggested to clamp below 16 V.                          |
| R <sub>CTAP</sub>  | 2 kΩ            | 2 kΩ series resistance; not required if pin left O/C  |
| R <sub>FG</sub>    | 500 Ω           | Optional – If FG wired to connector – R <sub>FG</sub> will isolate IC pin from noise or overvoltage transients or protect from connector issues   |
| R <sub>FGPU</sub>  | 10 kΩ           | Open-drain pull-up resistor – required if using pin for I <sup>2</sup> C  |
| R <sub>SPD</sub>   | 500 Ω           | Optional – If PWM wired to connector – R <sub>SPD</sub> will isolate IC pin from noise or overvoltage transients or protect from connector issues |
| R <sub>SPDPU</sub> | 10 kΩ           | Open-drain pull-up resistor – required if using pin for I <sup>2</sup> C  |
| R <sub>RD</sub>    | 10 kΩ           | Open-drain pull-up resistor – optional for RD function or test use  |

#### Layout Notes:

- 1. Add thermal vias to exposed pad area.
- 2. Add ground plane on top and bottom of PCB.
- 3. Place  $C_{\text{VREF}}$  and  $C_{\text{VBB}}$  as close as possible to IC, connected to GND plane.

## PACKAGE OUTLINE DRAWING

#### For Reference Only – Not for Tooling Use

(Reference Allegro DWG-0000222 Rev. 4 or JEDEC MO-220WGGD.)

Dimensions in millimeters – NOT TO SCALE.

Exact case and lead configuration at supplier discretion within limits shown.

Reference land pattern layout (reference IPC7351 QFN50P400X400X80-25W6M); all pads a minimum of 0.20 mm from all adjacent pads; adjust as necessary to meet application process requirements and PCB layout tolerances; when mounting on a multilayer PCB, thermal vias at the exposed thermal pad land can improve thermal dissipation (reference EIA/JEDEC Standard JESD51-5)

Coplanarity includes exposed thermal pad and terminals

Example 2 Branding scale and appearance at supplier discretion.
