

### Features

- Small sized 8-pin DIP type full molded package, optimum IC for low-height SMPS
- Off-timer circuit is provided on the monolithic control IC
- Low start-up circuit current (10uA typ)
- Low circuit current at operation (1.5mA typ)
- Avalanche energy guaranteed MOSFET with high VDSS
  - The built-in power MOSFET simplifies the surge absorption circuit since the MOSFET guarantees the avalanche energy.
  - No VDSS de-rating is required.
- Built-in Start-up circuit (the power loss in the start-up circuit is reduced by cutting off the start-up circuit after the IC starts its operation.)
- Auto Burst Stand-by (realizing input power < 0.1W at no load)
- Auto Bias Function (stable burst operation without the interference on transformer)
- Two operational modes by auto switching functions
  - For normal operation: PRC mode
  - For stand-by operation (at light load): Burst mode
- Built-in Leading Edge Blanking Function
- Built-in constant voltage drive circuit
- Various kinds of protection functions
  - Pulse-by-pulse Overcurrent Protection (OCP)
  - Overload Protection with auto recovery (OLP)
  - Overvoltage Protection with latch mode (OVP)
  - Thermal Shutdown with latch mode (TSD)

### Descriptions

IRIS-A6159 is a hybrid IC consisting of a power MOSFET and a controller IC, designed for PRC fly-back converter type SMPS (Switching Mode Power Supply) applications, applicable for PRC operation for small power SMPS. This IC realizes downsizing and standardizing of a power supply system reducing external component count and simplifying the circuit design.

Note: PRC is abbreviation for “Pulse Ratio Control” (On-width control with fixed OFF-time).

### Typical Connection Diagram

Note 1: The pout (W) represents the thermal rating at PRC Operation. The peak power output is obtained by approximating 120 to 140% of the above listed value. When the output voltage is low and ON-duty is narrow, the Pout (W) shall become lower than that of above value.

### Absolute Maximum Ratings (Ta=25°C)

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to terminals stated, all currents are defined positive into any lead. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.
