Document Title

1M X 18, 512K X 36 LVTTL, Pipelined ZeBL^{TM} SRAM

Revision History

Rev. No.	History	Issue Date	Remark
0.0	Initial issue	August, 20, 2005	Preliminary

Preliminary   *1M X 18, 512K X 36 LVTTL, Pipelined ZeBL^{TM} SRAM*

Features

- Fast access time:
  2.6/2.8/3.2/3.5/3.8/4.2 (250/227/200/166/150/133MHz)
- Zero Bus Latency between READ and WRITE cycles allows 100% bus utilization
- Signal +3.3V $\pm$ 5% power supply
- Individual Byte Write control capability
- Clock enable ($\overline{CEN}$) pin to enable clock and suspend operations

- Clock-controlled and registered address, data and control signals
- Registered output for pipelined applications
- Three separate chip enables allow wide range of options for CE control, address pipelining
- Internally self-timed write cycle
- Selectable BURST mode (Linear or Interleaved)
- SLEEP mode (ZZ pin) provided
- Available in 100 pin LQFP package

General Description

The AMIC Zero Bus Latency (ZeBL^{TM}) SRAM family employs high-speed, low-power CMOS designs using an advanced CMOS process.
The A67L0618, A67L9336 SRAMs integrate a 1M X 18, 512K X 36 SRAM core with advanced synchronous peripheral circuitry and a 2-bit burst counter. These SRAMs are optimized for 100 percent bus utilization without the insertion of any wait cycles during Write-Read alternation. The positive edge triggered single clock input (CLK) controls all synchronous inputs passing through the registers. The synchronous inputs include all address, all data inputs, active low chip enable ($\overline{CE}$), two additional chip enables for easy depth expansion (CE2, $\overline{CE2}$), cycle start input (ADV/$\overline{LD}$), synchronous clock enable ($\overline{CEN}$), byte write enables ($\overline{BW1}, \overline{BW2}, \overline{BW3}, \overline{BW4}$) and read/write (R/$\overline{W}$).
Asynchronous inputs include the output enable ($\overline{OE}$), clock (CLK), SLEEP mode (ZZ, tied LOW if unused) and burst mode (MODE). Burst Mode can provide either interleaved or linear operation, burst operation can be initiated by synchronous address Advance/Load (ADV/$\overline{LD}$) pin in Low state. Subsequent burst address can be internally generated by the chip and controlled by the same input pin ADV/$\overline{LD}$ in High state.

Write cycles are internally self-time and synchronous with the rising edge of the clock input and when R/$\overline{W}$ is Low. The feature simplified the write interface. Individual Byte enables allow individual bytes to be written. $\overline{BW1}$ controls I/Oa pins; $\overline{BW2}$ controls I/Ob pins; $\overline{BW3}$ controls I/Oc pins; and $\overline{BW4}$ controls I/Od pins. Cycle types can only be defined when an address is loaded.

The SRAM operates from a +3.3V power supply, and all inputs and outputs are LVTTL-compatible. The device is ideally suited for high bandwidth utilization systems.

Pin Description

Pin No.		Symbol	Description
LQFP (X18)	**LQFP (X36)**		
37 36 35, 34, 33, 32, 100, 99, 82, 81, 44, 45, 46, 47, 48, 49, 50, 83 84 80	37 36 35, 34, 33, 32, 100, 99, 82, 81, 45, 46, 47, 48, 49, 50, 83, 84 44	A0 A1 A2 - A9 A11 - A18 A19 A10	Synchronous Address Inputs : These inputs are registered and must meet the setup and hold times around the rising edge of CLK. A0 and A1 are the two lest significant bits (LSB) of the address field and set the internal burst counter if burst is desired.
93 ($\overline{BW1}$) 94 ($\overline{BW2}$)	93 ($\overline{BW1}$) 94 ($\overline{BW2}$) 95 ($\overline{BW3}$) 96 ($\overline{BW4}$)	$\overline{BW1}$ $\overline{BW2}$ $\overline{BW3}$ $\overline{BW4}$	Synchronous Byte Write Enables : These active low inputs allow individual bytes to be written when a WRITE cycle is active and must meet the setup and hold times around the rising edge of CLK. BYTE WRITEs need to be asserted on the same cycle as the address, BWs are associated with addresses and apply to subsequent data. $\overline{BW1}$ controls I/Oa pins; $\overline{BW2}$ controls I/Ob pins; $\overline{BW3}$ controls I/Oc pins; $\overline{BW4}$ controls I/Od pins.
89	89	CLK	Clock: This signal registers the address, data, chip enables, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock are rising edge.
98	98	$\overline{CE}$	Synchronous Chip Enable : This active low input is used to enable the device. This input is sampled only when a new external address is loaded (ADV/$\overline{LD}$ LOW).
92	92	$\overline{CE2}$	Synchronous Chip Enable : This active low input is used to enable the device and is sampled only when a new external address is loaded (ADV/$\overline{LD}$ LOW). This input can be used for memory depth expansion.
97	97	CE2	Synchronous Chip Enable : This active high input is used to enable the device and is sampled only when a new external address is loaded (ADV/$\overline{LD}$ LOW). This input can be used for memory depth expansion.
86	86	$\overline{OE}$	Output Enable : This active low asynchronous input enables the data I/O output drivers.
85	85	ADV/$\overline{LD}$	Synchronous Address Advance/Load : When HIGH, this input is used to advance the internal burst counter, controlling burst access after the external address is loaded. When HIGH, R/$\overline{W}$ is ignored. A LOW on this pin permits a new address to be loaded at CLK rising edge.
87	87	$\overline{CEN}$	Synchronous Clock Enable : This active low input permits CLK to propagate throughout the device. When HIGH, the device ignores the CLK input and effectively internally extends the previous CLK cycle. This input must meet setup and hold times around the rising edge of CLK.

Pin Description (continued)

Pin No.		Symbol	Description
LQFP (X18)	LQFP (X36)		
64	64	ZZ	Snooze Enable : This active high asynchronous input causes the device to enter a low-power standby mode in which all data in the memory array is retained. When active, all other inputs are ignored.
88	88	R/$\overline{W}$	Read/Write : This active input determines the cycle type when ADV/$\overline{LD}$ is LOW. This is the only means for determining READs and WRITEs. READ cycles may not be converted into WRITEs (and vice versa) other than by loading a new address. A LOW on this pin permits BYTE WRITE operations and must meet the setup and hold times around the rising edge of CLK. Full bus width WRITEs occur if all byte write enables are LOW.
74, 73, 72, 69, 68, 63, 62, 59, 58, 24, 23, 22, 19, 18 13, 12, 9, 8	51, 52, 53, 56, 57, 58, 59, 62, 63 68, 69, 72, 73, 74, 75, 78, 79, 80 1, 2, 3, 6, 7, 8, 9, 12, 13, 18, 19, 22, 23, 24, 25, 28, 29, 30	I/Oa I/Ob I/Oc I/Od	SRAM Data I/O : Byte "a" is I/Oa pins; Byte "b" is I/Ob pins; Byte "c" is I/Oc pins; Byte "d" is I/Od pins. Input data must meet setup and hold times around CLK rising edge.
31	31	MODE	Mode : This input selects the burst sequence. A LOW on this pin selects linear burst. NC or HIGH on this pin selects interleaved burst. Do not alter input state while device is operating.
1, 2, 3, 6, 7, 25, 28, 29, 30, 38, 39, 42,43 51, 52, 53, 56, 57, 75, 78, 79, 95, 96	38,39,42,43	NC	No Connect : These pins can be left floating or connected to GND to minimize thermal impedance.
15, 41, 65, 91	15, 41, 65, 91	VCC	Power Supply : See DC Electrical Characteristics and Operating Conditions for range.
14, 16, 66	14, 16, 66	VCC	These pins do not have to be connected directly to VCC as long as the input voltage is ≥ V$_{IH}$. This input is not connected to VCC bus internally.
4, 11, 20, 27, 54, 61, 70, 77	4, 11, 20, 27, 54, 61, 70, 77	VCCQ	Isolated Output Buffer Supply : See DC Electrical Characteristics and Operating Conditions for range.

IGNORE Clock Edge (Stall)	Current	X	X	X	L	X	X	X	X	H	L→H	-	4
SLEEP Mode	None	X	X	X	H	X	X	X	X	X	X	High-Z	

Notes:

1. Continue Burst cycles, whether READ or WRITE, use the same control inputs. The type of cycle performed (READ or WRITE) is chosen in the initial Begin Burst cycle. A Continue Deselect cycle can only be entered if a Deselect cycle is executed first.
2. Dummy READ and WRITE Abort cycles can be considered NOPs because the device performs no operation. A WRITE Abort means a WRITE command is given, but no operation is performed.
3. $\overline{OE}$ may be wired LOW to minimize the number of control signals to the SRAM. The device will automatically turn off the output drivers during a WRITE cycle. Some users may use $\overline{OE}$ when the bus turn-on and turn-off times do not meet their requirements.
4. If an Ignore Clock Edge command occurs during a READ operation, the I/O bus will remain active (Low-Z). If it occurs during a WRITE cycle, the bus will remain in High-Z. No WRITE operations will be performed during the Ignored Clock Edge cycle.
5. X means "Don't Care." H means logic HIGH. L means logic LOW. $\overline{BWx}$ = H means all byte write signals ($\overline{BW1}, \overline{BW2}, \overline{BW3}$ and $\overline{BW4}$) are HIGH. $\overline{BWx}$ = L means one or more byte write signals are LOW.
6. $\overline{BW1}$ enables WRITEs to Byte "a" (I/Oa pins); $\overline{BW2}$ enables WRITEs to Byte "b" (I/Ob pins); $\overline{BW3}$ enables WRITEs to Byte "c" (I/Oc pins); $\overline{BW4}$ enables WRITEs to Byte "d" (I/Od pins).
7. The address counter is incremented for all Continue Burst cycles.

Partial Truth Table for READ/WRITE Commands (X18)

Operation	R/$\overline{W}$	$\overline{BW1}$	$\overline{BW2}$
READ	H	X	X
WRITE Byte "a"	L	L	H
WRITE Byte "b"	L	H	L
WRITE all bytes	L	L	L
WRITE Abort/NOP	L	H	H

Note : Using and BYTE WRITE(s), any one or more bytes may be written.

Partial Truth Table for READ/WRITE Commands (X36)

Operation	R/$\overline{W}$	$\overline{BW1}$	$\overline{BW2}$	$\overline{BW3}$	$\overline{BW4}$
READ	H	X	X	X	X
WRITE Byte "a"	L	L	H	H	H
WRITE Byte "b"	L	H	L	H	H
WRITE Byte "c"	L	H	H	L	H
WRITE Byte "d"	L	H	H	H	L
WRITE all bytes	L	L	L	L	L
WRITE Abort/NOP	L	H	H	H	H

Note : Using R/$\overline{W}$ and BYTE WRITE(s), any one or more bytes may be written.

Absolute Maximum Ratings*

Power Supply Voltage (VCC) . . . . -0.3V to +4.6V
Voltage Relative to GND for any Pin Except VCC (Vin, Vout) . . . . -0.3V to VCC +0.3V
Operating Temperature (Topr) . . . . 0°C to 70°C
Storage Temperature (Tbias) . . . . -10°C to 85 °C
Storage Temperature (Tstg) . . . . -55°C to 125°C

*Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

DC Electrical Characteristics and Operating Conditions

(0°C $\leq$ T$_A$ $\leq$ 70°C, VCC, VCCQ = +3.3V$\pm$ 5% unless otherwise noted)

t$_{KHEX}$	Clock enable ($\overline{CEN}$)	0.3	-	0.4	-	0.4	-	0.5	-	0.5	-	0.5	-	ns	5
t$_{KHCX}$	Control signals	0.3	-	0.4	-	0.4	-	0.5	-	0.5	-	0.5	-	ns	5
t$_{KHDX}$	Data-in	0.3	-	0.4	-	0.4	-	0.5	-	0.5	-	0.5	-	ns	5

Notes: 1. This parameter is sampled.

2. Output loading is specified with C1=5pF as in Figure 2.

3. Transition is measured ±200mV from steady state voltage.

4. $\overline{OE}$ can be considered a "Don't Care" during WRITE; however, controlling $\overline{OE}$ can help fine-tune a system for turnaround timing.

5. This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when ADV/$\overline{LD}$ is LOW and chip enabled. All other synchronous inputs meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK (when ADV/$\overline{LD}$ is LOW) to remain enabled.

AC Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Times	1.0ns
Input Timing Reference Levels	1.25V
Output Reference Levels	1.25V
Output Load	See Figures 1 and 2
Figure 1
Output Load Equivalent
Figure 2
Output Load Equivalent

SLEEP Mode

SLEEP Mode is a low current "Power-down" mode in which the device is deselected and current is reduced to I_{SB2Z}. This duration of SLEEP Mode is dictated by the length of time the ZZ is in a HIGH state. After entering SLEEP Mode, all inputs except ZZ become disabled and all outputs go to High-Z.
The ZZ pin is asynchronous, active high input that causes the device to enter SLEEP Mode. When the ZZ pin becomes logic HIGH, ISB2Z is guaranteed after the time t_{ZZI} is met.

Any operation pending when entering SLEEP Mode is not guaranteed to successfully complete. Therefore, SLEEP Mode (READ or WRITE) must not be initiated until valid pending operations are completed. Similarly, when exiting SLEEP Mode during t_{RZZ}, only a DESELECT or READ cycle should be given while the SRAM is transitioning out of SLEEP Mode.

SLEEP Mode Electrical Characteristics

(VCC, VCCQ = +3.3V±5%)

Symbol	Parameter	Conditions	Min.	Max.	Unit	Note
I_{SB2Z}	Current during SLEEP Mode	ZZ ≥ V$_{IH}$	-	60	mA	
t_{ZZ}	ZZ active to input ignored		0	2(t_{KHKH})	ns	1
t_{RZZ}	ZZ inactive to input sampled		0	2(t_{KHKH})	ns	1
t_{ZZI}	ZZ active to snooze current		-	2(t_{KHKH})	ns	1
t_{RZZI}	ZZ inactive to exit snooze current		0		ns	1

Note : 1. This parameter is sampled.

SLEEP Mode Waveform

: Don't Care
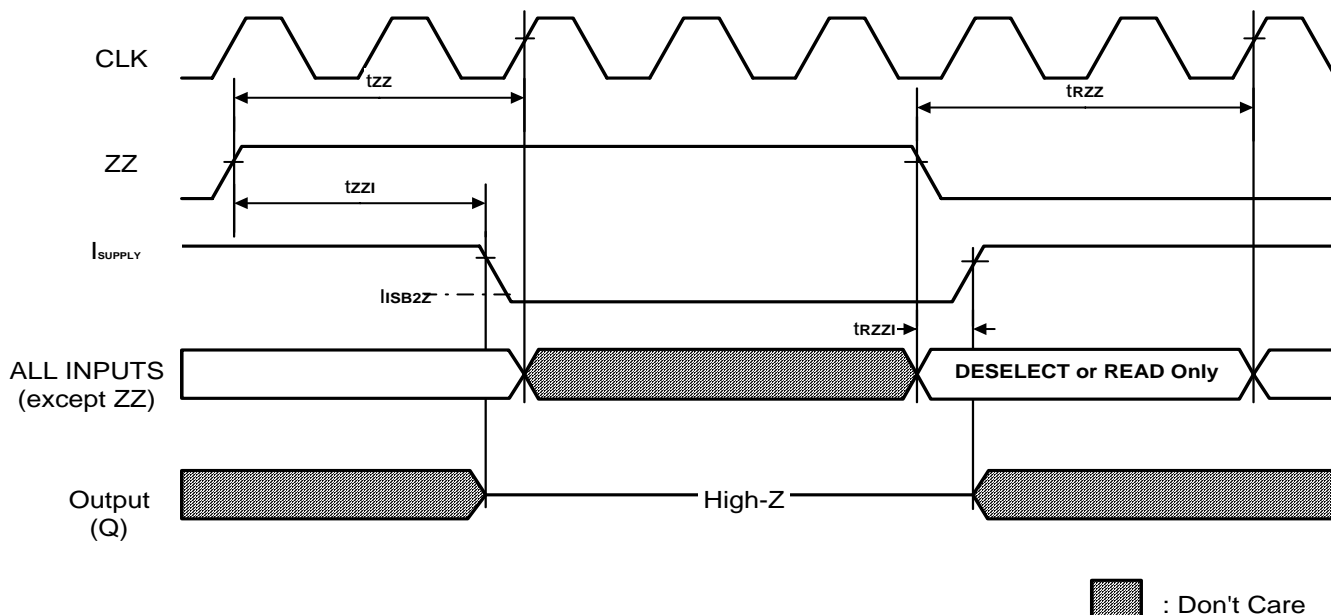

READ/WRITE Timing
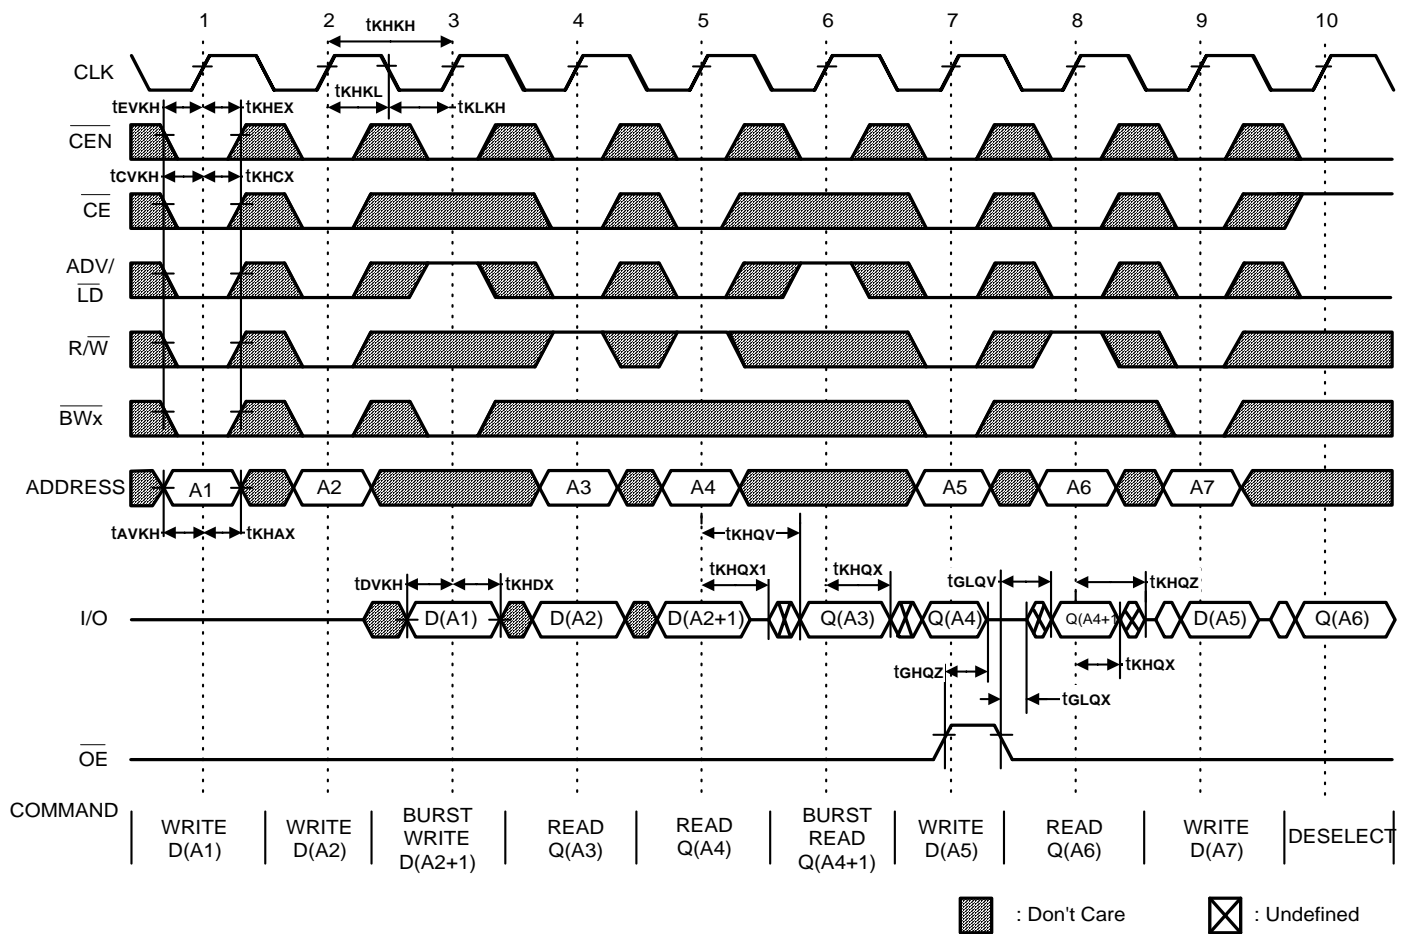

Note : 1. For this waveform, ZZ is tied LOW.
2. Burst sequence order is determined by MODE (0 = linear, 1 = interleaved). BRST operations are optional.
3. $\overline{CE}$ represents three signals. When $\overline{CE}$ = 0, it represents $\overline{CE}$ = 0, $\overline{CE2}$ = 0, CE2 = 1.
4. Data coherency is provided for all possible operations. If a READ is initiated the most current data is used. The most recent data may be from the input data register.

NOP, STALL and Deselect Cycles
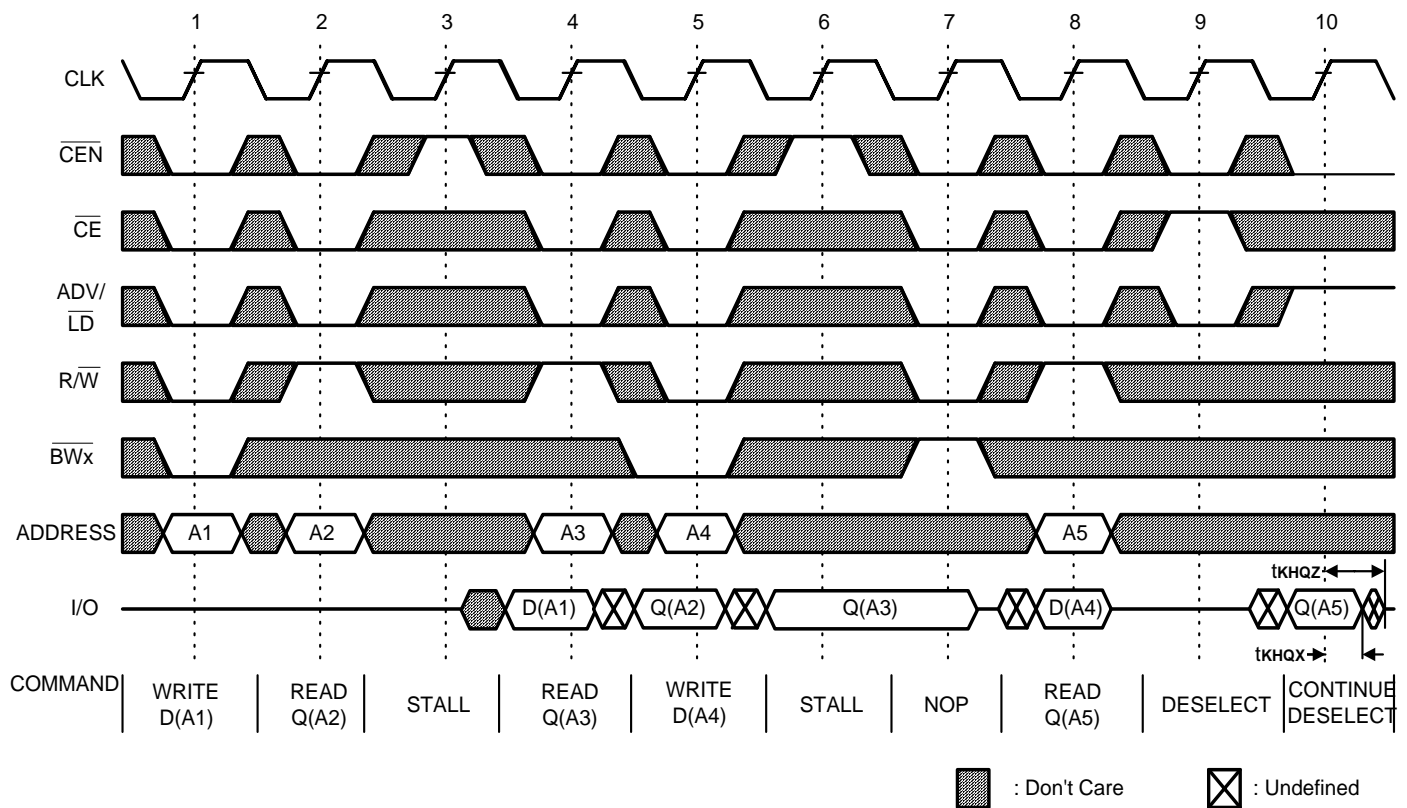

Note : 1. The IGNORE CLOCK EDGE or STALL cycle (clock 3) illustrates $\overline{CEN}$ being used to create a "pause." A WRITE is not performed during this cycle.
    2. For this waveform, ZZ and $\overline{OE}$ are tied LOW.
    3. $\overline{CE}$ represents three signals. When $\overline{CE}$ = 0, it represents $\overline{CE}$ = 0, $\overline{CE}2$ = 0, CE2 = 1.
    4. Data coherency is provided for all possible operations. If a READ is initiated, the most current data is used. The most recent data may be from the input data register.

Notes:
1. Dimensions D and E do not include mold protrusion.
2. Dimensions b does not include dambar protrusion.
   Total in excess of the b dimension at maximum material condition.
   Dambar cannot be located on the lower radius of the foot.
