■ General Description

The AD6315 is a VFD (Vacuum Fluorescent Display or fluorescent Indicator Panel) driver that is driven on a 1/4- to 1/12- duty factor. It consists of 16 segments and 4 grids output lines, 8 segments / grid output driving lines, a display memory, a control circuit, and a key scan circuit. Serial data is input to the AD6315 through a 3-wire serial interface. This VFD driver is ideal as a peripheral device for a single-chip microcomputer.

■ Pin Descriptions

Symbol	Name	No.	Description
D _{IN}	Data input	7	Input serial data at rising edge of shift clock, starting from the low order bit.

1/4- to 1/12 Duty VFD Controller/Driver

(2) Key Matrix and Key-input Data Storage RAM

The key matrix is made up of a 16 X 2 matrix, as shown below.

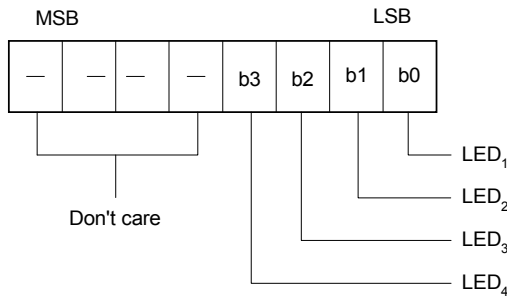

The data of each key is stored as follows, and is read with the read command starting from the least significant bit.

(3) LED Port

Data is written to the LED port with the write command, starting from the least significant bit. "L" output when the bit of this port is 0, and "H" output when the bit is 1. The data of bits after the 5th bit are ignored.

Note: On power application, all the LED ports are "L" output.

(4) Commands

Commands set the display mode and status of the VFD driver.

The first 1 byte input to the AD6315 through the DIN pin after the STB pin has fallen is regarded as a command. If STB is set high while commands/data are transmitted, serial communication is initialized, and the commands/data being transmitted are invalid (however, the commands/data previously transmitted remain valid).

1/4- to 1/12 Duty VFD Controller/Driver

(I) Display mode setting commands

These commands initialize the AD6315 and select the number of segments and the number of grids (1/4- to 1/12- duty, 16 segments to 24 segments).

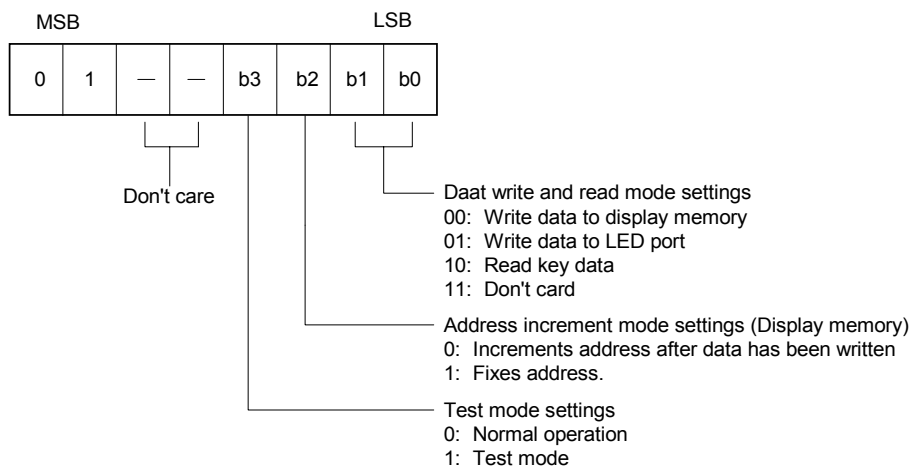

When these commands are executed, the display is forcibly turned off, and key scanning is also stopped. To resume display, the display command "ON" must be executed. If the same mode is selected, however, nothing happens.

Note: On power application, the 12-digit, 16-segment mode is selected.

(II) Data setting commands

These commands set data write and data read modes.

Note: For power application, the normal operation and address increment modes are set.

1/4- to 1/12 Duty VFD Controller/Driver

(III) Address setting command

These commands set an address of the display memory.

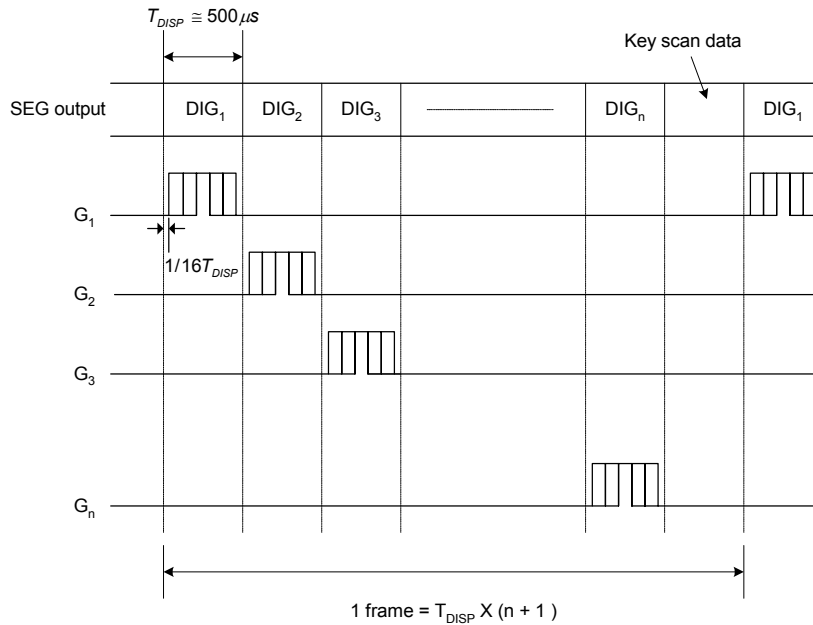

Note : (a) If address 24H or higher is set, data is ignored, until a valid address is set.
 (b) On power application, the address is set to 00H.

(IV) Display control commands

Note : (a) On power application, key scanning is stopped.
 (b) 1/16 pulse width is set and the display is turned off.

(5) Key Scanning And Display Timing

Note : One cycle of key scanning consists of two frame, and data in 1 16 X 2 matrix is stored in RAM.

(6) Key Scan Expansion

1st frame		1	2	3	4	5	6	7	8	
2nd frame	DIG _n	9	10	11	12	13	14	15	16	DIG ₁

(7) Serial Communication Format

Reception (command/data write)

1/4- to 1/12 Duty VFD Controller/Driver

Transmission (data read)

Note : When data is read, a wait time t_{WAIT} of 1 μ s is necessary since the rising of the eighth clock that has set the command, until the falling of the first clock that has read the data.

Remark : Because the D_{OUT} pin is an N-ch, open-drain output pin, be sure to connect an external pull-up resistor (1 k Ω to 10 k Ω) to this pin.

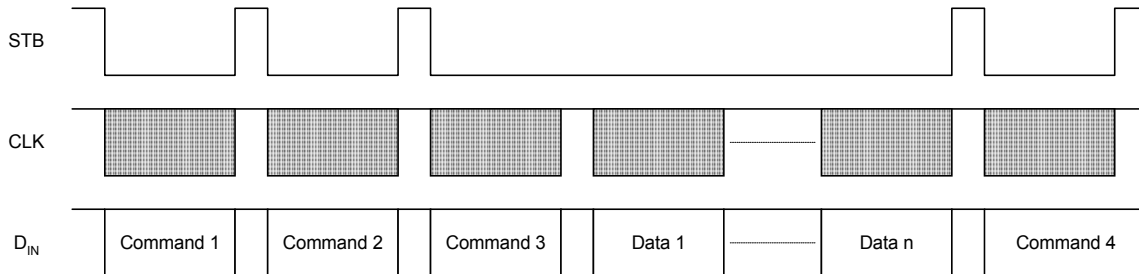

(8) Switching Characteristic Waveforms

Typical Characteristics (Unless otherwise specified, $T_A = 25^\circ\text{C}$, $V_{DD} = 5\text{V}$, $V_{EE} = V_{DD} - 35\text{V}$)

(9) Applications

Updating specific address

- Command 1 : sets data
- Command 2 : sets address
