## **2x31W Stereo / 1x62W Mono Digital Audio Amplifier With 40 bands EQ and DRC Functions**

---

### **Features**

- 16/18/20/24-bits input with I<sup>2</sup>S, Left-alignment and Right-alignment and TDM data format
- PSNR & DR(A-weighting)  
Loudspeaker: 107dB (PSNR), 108dB (DR)@24V
- Multiple sampling frequencies (Fs)  
8kHz, 16kHz, 32kHz/44.1kHz/48kHz and 88.2kHz/96kHz
- System clock = 32x, 48x, 64x, 96x, 128x, 192x, 256x Fs  
BCLK system:  
32x~256x Fs for 8kHz, 16kHz and 32kHz / 44.1kHz / 48kHz and 88.2kHz / 96kHz
- Supply voltage  
3.3V/1.8V for digital circuit  
4.5V~26V for loudspeaker driver
- Supports 2.0CH/Mono configuration
- Loudspeaker output power@12V for stereo  
7W x 2CH into 8Ω <1% THD+N  
10W x 2CH into 4Ω <1% THD+N
- Loudspeaker output power@18V for stereo  
15W x 2CH into 8Ω <1% THD+N
- Loudspeaker output power@24V for stereo  
31W x 2CH into 8Ω <1% THD+N
- Sound processing including :  
40 bands parametric EQ  
Volume control (+24dB~-103dB, 0.125dB/step)  
Three Band plus post Dynamic range control  
Auto Gain Limiter  
Power Clipping  
Programmed 3D surround sound  
Channel mixing  
Noise gate with hysteresis window  
DC-blocking high-pass filter  
Pre-scale/post-scale  
I<sup>2</sup>S output with user programmed gain (+24dB~mute)
- I<sup>2</sup>S/TDM output with selectable Audio DSP point
- Anti-pop design
- Level meter and power meter
- Short circuit and over-temperature protection
- Over voltage protection

- Supports Dynamic Temperature Control (DTC)
- Supports I<sup>2</sup>C control without clock
- I<sup>2</sup>C control interface with 4 selectable device address
- LV Under-voltage shutdown and HV Under-voltage detection
- Auto clock detection
- Power saving mode

### **Applications**

- TV audio
- Boom-box, CD and DVD receiver, docking system
- Powered speaker
- Wireless audio

### **Description**

AD82178 is a digital audio amplifier capable of driving 25W (31W peak) each to a pair of 8Ω load speaker (BTL) and 50W (62W peak) to a 4Ω load speaker (PBTL) operating at 24V supply without external heat-sink or fan requirement with play music.

AD82178 provides advanced audio processing functions, such as volume control, 40 EQ bands, audio mixing, 3D surround sound and Dynamic Range Control (DRC) and Auto Gain Limiter (AGL). These are fully programmable via a simple I<sup>2</sup>C control interface. Robust protection circuits are provided to protect AD82178 from damage due to accidental erroneous operating condition. The full digital circuit design of AD82178 is more tolerant to noise and PVT (Process, Voltage, and Temperature) variation than the analog class-AB or class-D audio amplifier counterpart implemented by analog circuit design. AD82178 is pop free during instantaneous power on/off or mute/shut down switching because of its robust built-in anti-pop circuit.

## Pin Assignment

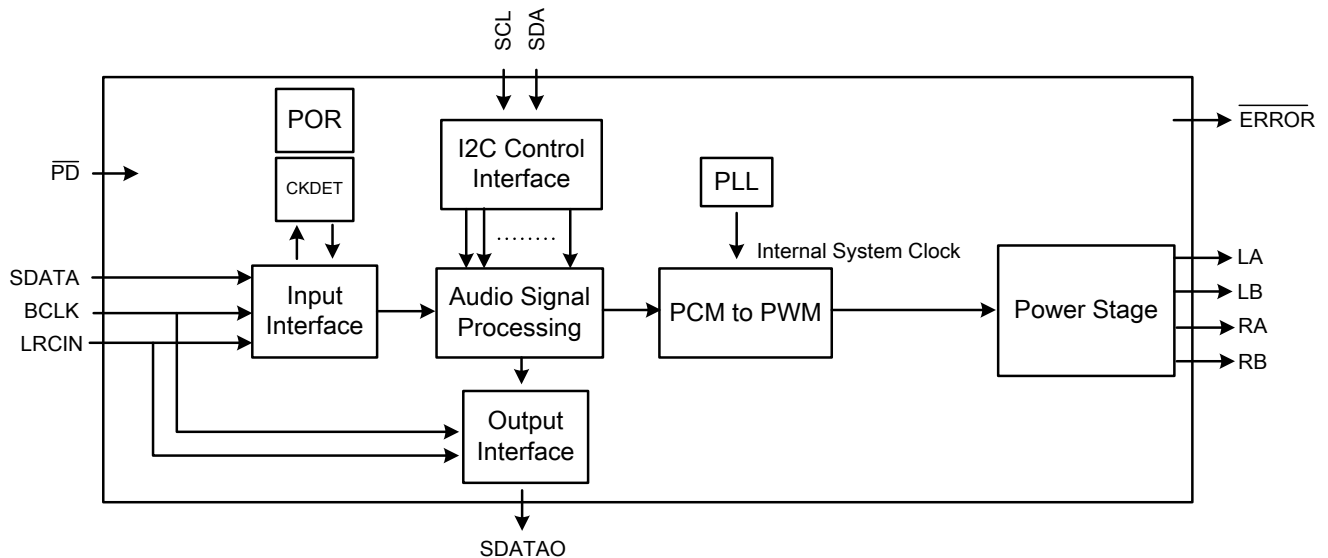

## Pin Description (E-TSSOP 24L)

PIN	NAME	TYPE	DESCRIPTION	CHARACTERISTICS
1	$\overline{\text{ERROR}}$	I/O	ERROR pin is a dual function pin. One is I <sup>2</sup> C address setting during power up. The other one is error status report (low active). It sets by register of A_SEL_FAULT at address 0x1C B[6] to enable it.	This pin is monitored on the rising edge of reset. It will determine the slave address of AD82178 and define in the device addressing part.
2	$\overline{\text{PD}}$	I	Power down, low active.	Schmitt trigger TTL input buffer, internal pull High with a 330Kohm resistor.
3	LRCIN	I	Left/Right clock input (Fs).	Schmitt trigger TTL input buffer, internal pull Low with a 100Kohm resistor.
4	BCLK	I	Bit clock input (64Fs).	Schmitt trigger TTL input buffer, internal pull Low with a 100Kohm resistor.
5	SDATA	I	Serial audio data input.	Schmitt trigger TTL input buffer
6	SDA	I/O	I <sup>2</sup> C bi-directional serial data.	Schmitt trigger TTL input buffer
7	SCL	I	I <sup>2</sup> C serial clock input.	Schmitt trigger TTL input buffer
8	SDATAO	O	Serial audio data output.	Schmitt trigger TTL input buffer
9	DVDD	P	Digital Power.	
10	DGND	P	Digital Ground.	

11	VREG	O	1.5V Regulator voltage output.	
12	GVDD	O	5V Regulator voltage output. This pin must not be used to drive external devices.	
13	BST_RB	P	Bootstrap supply for right channel output B.	
14	VDDR	P	Right channel supply.	
15	RB	O	Right channel output B.	
16	GNDR	P	Right channel ground.	
17	RA	O	Right channel output A.	
18	BST_RA	P	Bootstrap supply for right channel output A.	
19	BST_LB	P	Bootstrap supply for left channel output B.	
20	LB	O	Left channel output B.	
21	GNDL	P	Left channel ground.	
22	LA	O	Left channel output A.	
23	VDDL	P	Left channel supply.	
24	BST_LA	P	Bootstrap supply for left channel output A.	

**Functional Block Diagram**

**Ordering Information**

Product ID	Package	Packing / MPQ	Comments
AD82178-QG24NRR	E-TSSOP 24L	2.5K Units / Reel 1 Reel / Small box	Green

## Available Package

Package Type	Device No.	$\theta_{ja}$ (°C/W)	$\Psi_{jt}$ (°C/W)	$\theta_{jt}$ (°C/W)	Exposed Thermal Pad
E-TSSOP 24L	AD82178	26.8	1.83	27.1	Yes (Note1)

Note 1.1: The thermal pad is located at the bottom of the package. To optimize thermal performance, soldering the thermal pad to the PCB's ground plane is suggested.

Note 1.2:  $\theta_{ja}$ , the junction-to-ambient thermal resistance is simulated on a room temperature ( $T_A=25^\circ\text{C}$ ), natural convection environment test board, which is constructed with a thermally efficient, 4-layers PCB (2S2P). The simulation is tested using the JESD51-5 thermal measurement standard.

Note 1.3:  $\Psi_{jt}$  represents the thermal parameter for the heat flow between the chip junction and the package's top surface center. It's extracted from the simulation data for obtaining  $\theta_{ja}$ , using a procedure described in JESD51-2.

Note 1.4:  $\theta_{jt}$  represents the thermal resistance for the heat flow between the chip junction and the package's top surface. It's extracted from the simulation data with obtaining a cold plate on the package top.

		DVDD=1.8V			0.4	V
C <sub>I</sub>	Input Capacitance			6.4		pF

Note 2: Loudspeaker over-current protection is only effective when loudspeaker drivers are properly connected with external LC filters. Please refer to the application circuit example for recommended LC filter configuration.

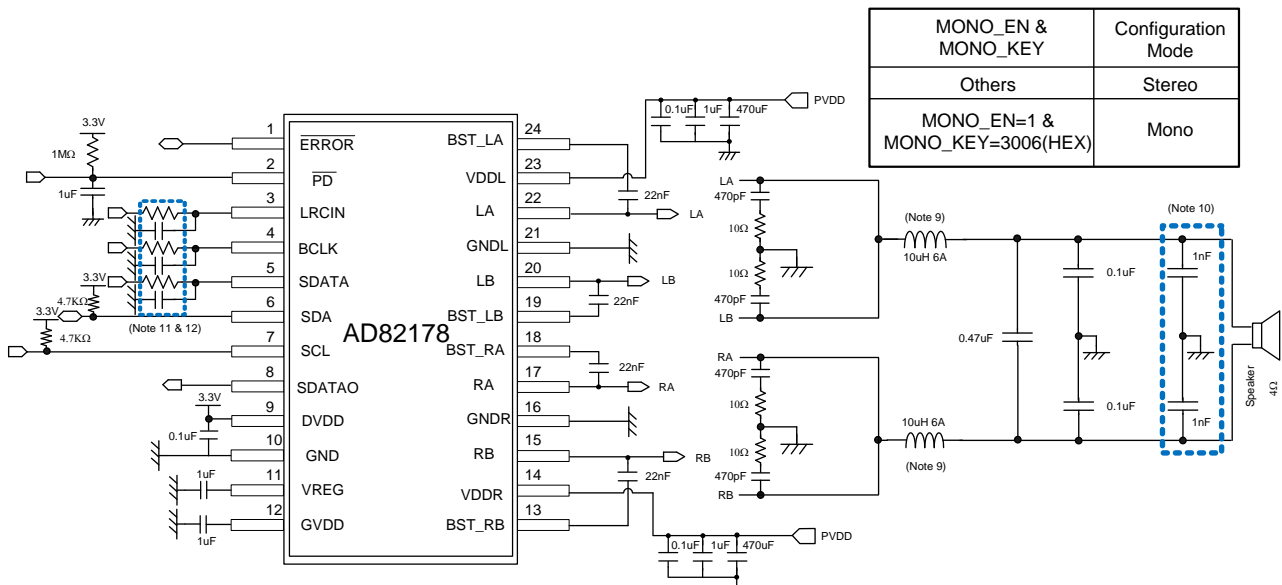

Note 3: This doesn't include bond-wire or pin resistance.

**Application Circuit Example for Stereo**

- Note 4: When concerning about short-circuit protection or performance, it is suggested using the choke with its  $I_{DC}$  larger than  $I_{SC}$ .
- Note 5: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.
- Note 6: The snubber circuit is used to suppress overshoot voltage on output pin, and it is also helpful with EMI suppression.
- Note 7: The signal integrity should be taken care of here due to its effect on SOC driving current + PCB layout route + input capacitor of AD82178. The signal with strict overshoot/undershoot can induce Incorrect PLL clock . The signal quality should be taken care of here through SOC driving current adjustment or the addition of RC components (R: 0~100ohm and C: <100pF or open are recommended) in order to improve it.
- Note 8: Placing the RC components as close as possible to the I<sup>2</sup>S pins of AD82178. When placing layout traces, it is necessary to place shielding ground for each I<sup>2</sup>S pin between the SOC and AD82178.

**Application Circuit Example for Mono**

MONO_EN & MONO_KEY	Configuration Mode
Others	Stereo
MONO_EN=1 & MONO_KEY=3006(HEX)	Mono

Capacitive load for each bus line	$C_b$		400		400	pF

**Operation Description**

The default volume of AD82178 is muted. AD82178 will be activated while the de-mute command via I<sup>2</sup>C is programmed.

● **Internal PLL**

AD82178 has a built-in PLL internally, the BCLK/FS, which is selected by I<sup>2</sup>C control interface. The clock inputted into the BCLK pin becomes the frequency of multiple edge evaluation in chip internally.

Fs	BCLK/FS Setting Ratio for PLL	BCLK Frequency	Multiple edge evaluation for bit clock	PWM Career Frequency
96kHz	64x	6.144MHz	32x	384kHz
88.2kHz	64x	5.6448MHz	32x	352.8kHz
48kHz	64x	3.072MHz	64x	384kHz
44.1kHz	64x	2.8224MHz	64x	352.8kHz
32kHz	64x	2.048MHz	64x	256kHz
16kHz	64x	1.024MHz	128x	256kHz
8kHz	64x	0.512MHz	256x	256kHz

● **Power down control**

AD82178 has a built-in volume fade-in/fade-out design for PD/Mute function. The relative PD timing diagrams for loudspeakers are shown below.

$$\left(10^{\frac{t_{\text{arg et}}(dB)}{20}} - 10^{\frac{\text{original}(dB)}{20}}\right) \times 128 \times (1/96K)$$

(Note: Address 0x1C B[2] = 0)

The volume level will be decreased to  $-\infty$  dB in several LRCIN cycles. Once the fade-out procedure is

finished, AD82178 will turn off the power stages, clock signals (for digital circuits) and current (for analog circuits). After PD pin is pulled low, AD82178 requires  $T_{\text{fade}}$  to finish the forementioned work before entering power down state. User can not program AD82178 during power down state. Also, all settings in the registers will remain intact unless DVDD is removed.

If the PD signal is removed during the fade-out procedure (above, right figure), AD82178 will still execute the fade-in procedure. In addition, AD82178 will establish the analog circuits' bias current and send the clock signals to digital circuits. Afterwards, AD82178 will return to its normal status.

- **Self-protection circuits**

AD82178 has built-in protection circuits including thermal, short-circuit, under-voltage detection, and over voltage circuits.

- (i) When the internal junction temperature is higher than  $160^{\circ}\text{C}$ , power stages will be turned off and AD82178 will return to normal operation once the temperature drops to  $125^{\circ}\text{C}$ . The temperature values may vary around 10%.
- (ii) The short-circuit protection circuit protects the output stage when the wires connected to loudspeakers are shorted to each other or GND/VDD. For normal 24V operations, the current flowing through the power stage will be less than 8A for stereo configuration. Otherwise, the short-circuit detectors may pull the  $\overline{\text{ERROR}}$  pin to DGND, disabling the output stages. When the over-temperature or short-circuit condition occurs, the open-drain  $\overline{\text{ERROR}}$  pin will be pulled low and latched into ERROR state.

Once short-circuit condition is removed, AD82178 will exit ERROR state when one of the following conditions is met: (1)  $\overline{\text{PD}}$  pin is pulled low, (2) Master mute is enabled through the I<sup>2</sup>C interface.

- (iii) Once the DVDD voltage is lower than 1.35V when address0x00 B[1] = 0, AD82178 will turn off its loudspeaker power stages and reset. When DVDD becomes higher than 1.5V, AD82178 will return to normal operation.
- (iv) Once the PVDD voltage is higher than 29.5V, AD82178 will turn off its loudspeaker power stages. When PVDD becomes lower than 28.5V, AD82178 will return to normal operation.
- (v) Once the PVDD voltage is lower than 3.8V when address0x1B B[2:0] = 000, AD82178 will turn off its loudspeaker power stages. When PVDD becomes higher than 4.2V, AD82178 will return to normal operation.

- Anti-pop design

AD82178 will generate appropriate control signals to suppress pop sounds during initial power on/off, power down/up, mute, and volume level changes.

- 3D surround sound

AD82178 provides the virtual surround sound technology with greater separation and depth voice quality for stereo signals.

- Error indicator

$\overline{\text{ERROR}}$  is a protection indicator when A\_SEL\_FAULT(0X1C, B[6]) register is setting high. If OVP/OCP/OTP occur, ERROR pin will be low.

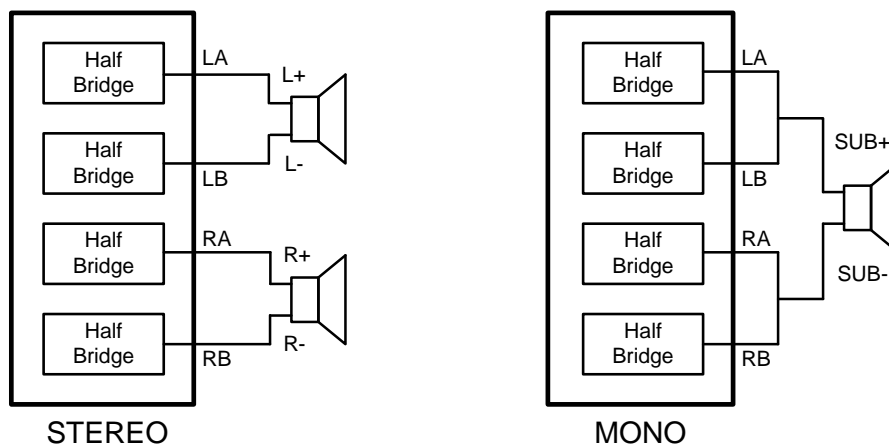

- Output configuration

AD82178 can be configured to mono (PBTL) via I<sup>2</sup>C control, set register MONO\_EN=1 (register 0X1A, B[3]) and MONO\_KEY = 3006 (HEX) (register 0X5B & 0X5C) to entry PBTL configuration.

Table 2

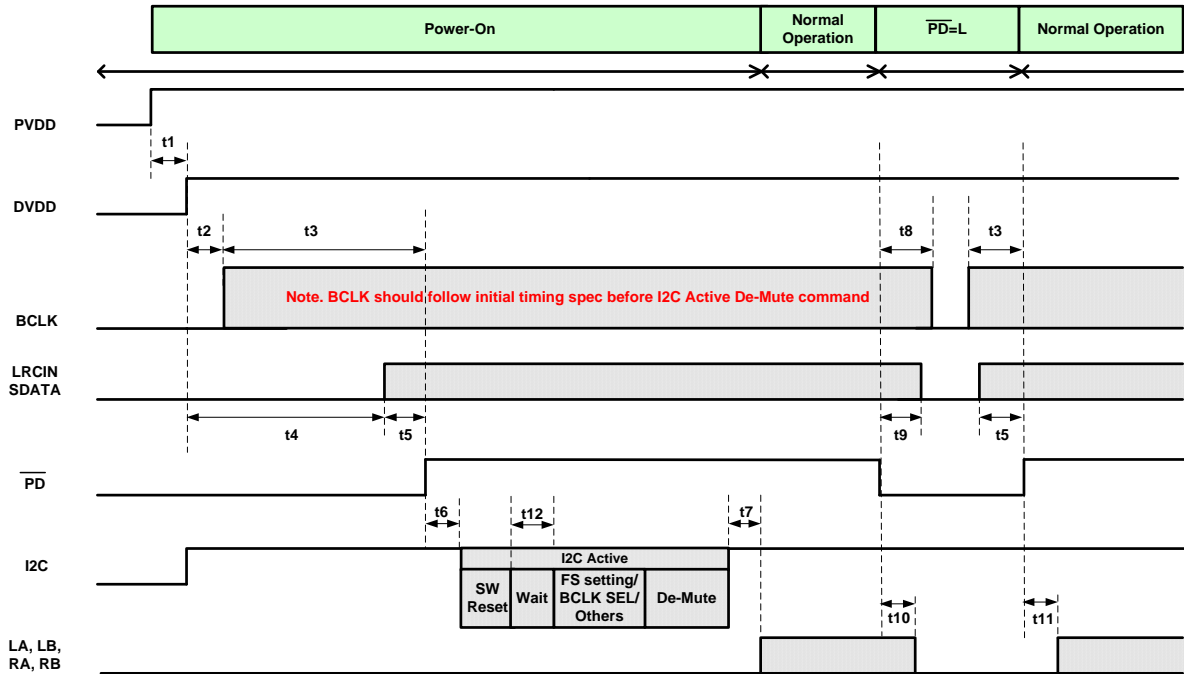

MONO_EN & MONO_KEY	Configuration Mode
Others	Stereo
Mono via I <sup>2</sup> C control (MONO_EN=1 and MONO_KEY=3006(HEX))	Mono

- Configuration figures:

● Power on sequence

Hereunder is AD82178's power on sequence. Give a de-mute command via I<sup>2</sup>C when the whole system is stable.

Note:

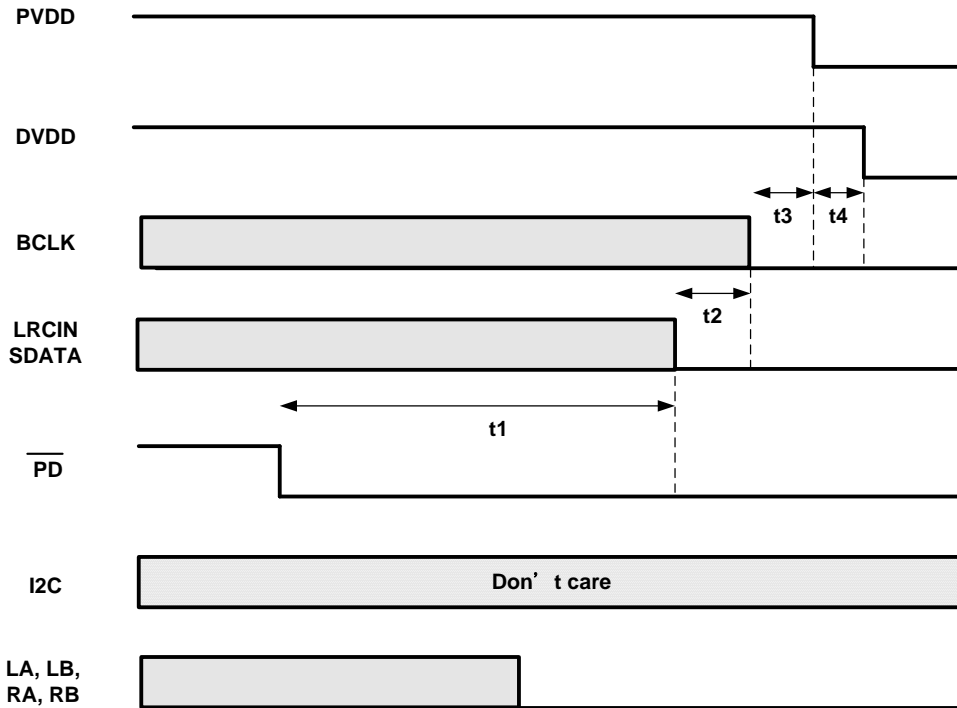

1. It doesn't matter if PVDD or DVDD comes up first.
2. Please be noted below sequence shall be follow up with "I2C Active" processing,
  - (1) Set S/W reset bit = 0 → (2) Delay 5ms → (3) Set S/W reset bit = 1 → (4) Delay 20ms → (5) Set all channels = mute (setting address 0X02 = 0X7F) → (6) Set sampling frequency and other registers (except setting address 0X02) → (7) Set all channels = de-mute (setting address 0X02 = 0X00).

t2		0	-	msec
t3		1	-	msec
t4		1	-	msec

## I<sup>2</sup>C-Bus Transfer Protocol

### ● Introduction

AD82178 employs I<sup>2</sup>C-bus transfer protocol. Two wires, serial data and serial clock carry information between the devices connected to the bus. Each device is recognized by a unique 7-bit address and can operate as either a transmitter or a receiver. The master device initiates a data transfer and provides the serial clock on the bus. AD82178 is always an I<sup>2</sup>C slave device.

### ● Protocol

#### ■ START and STOP condition

START is identified by a high to low transition of the SDA signal. A START condition must precede any command for data transfer. A STOP is identified by a low to high transition of the SDA signal. A STOP condition terminates communication between AD82178 and the master device on the bus. In both START and STOP, the SCL is stable in the high state.

#### ■ Data validity

The SDA signal must be stable during the high period of the clock. The high or low change of SDA only occurs when SCL signal is low. AD82178 samples the SDA signal at the rising edge of SCL signal.

#### ■ Device addressing

The master generates 7-bit address to recognize slave devices. If DEV\_NUM=1 (register 0X1C, B[7]), AD82178 slave address can be selected by  $\overline{\text{ERROR}}$  in the following table.

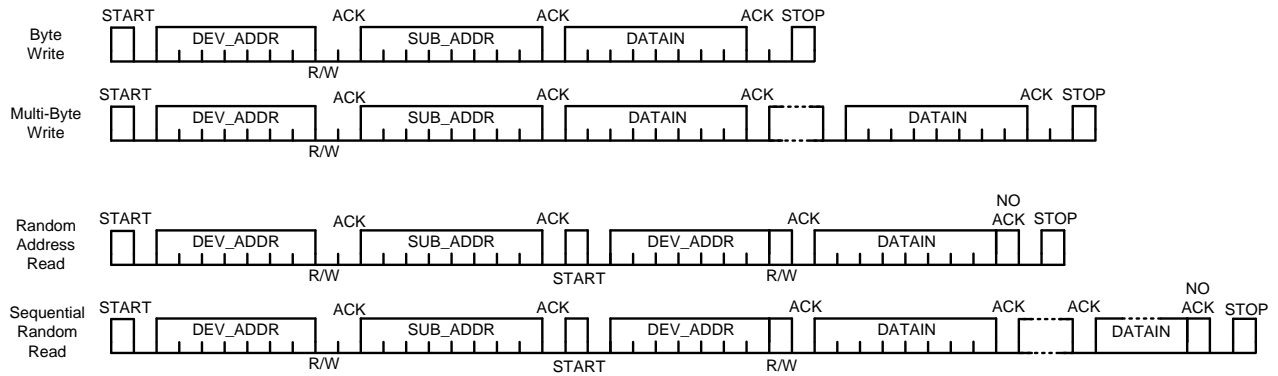

I<sup>2</sup>C slave address configuration when DEV\_NUM is 1.

ERROR pin configuration	MSBs				User Define			LSB
	0	1	0	0	0	0	0	
4.7k $\Omega$ to DVDD	0	1	0	0	0	0	0	R/W
15k $\Omega$ to DVDD	0	1	0	0	0	0	1	R/W
47k $\Omega$ to DVDD	0	1	0	0	1	0	0	R/W
120k $\Omega$ to DVDD	0	1	0	0	1	0	1	R/W

If DEV\_NUM=0, AD82178 receives 7-bit address matched with 0100000 (0x20) or 0100001 (0x21) depend on  $\overline{\text{ERROR}}$  pin state during power up ( $\overline{\text{ERROR}}$  pin state before changing A\_SEL\_FAULT=1). AD82178 will acknowledge at the 9th bit (the 8th bit is for R/W bit). The bytes following the device identification address are for AD82178 internal sub-addresses.

■ Data transferring

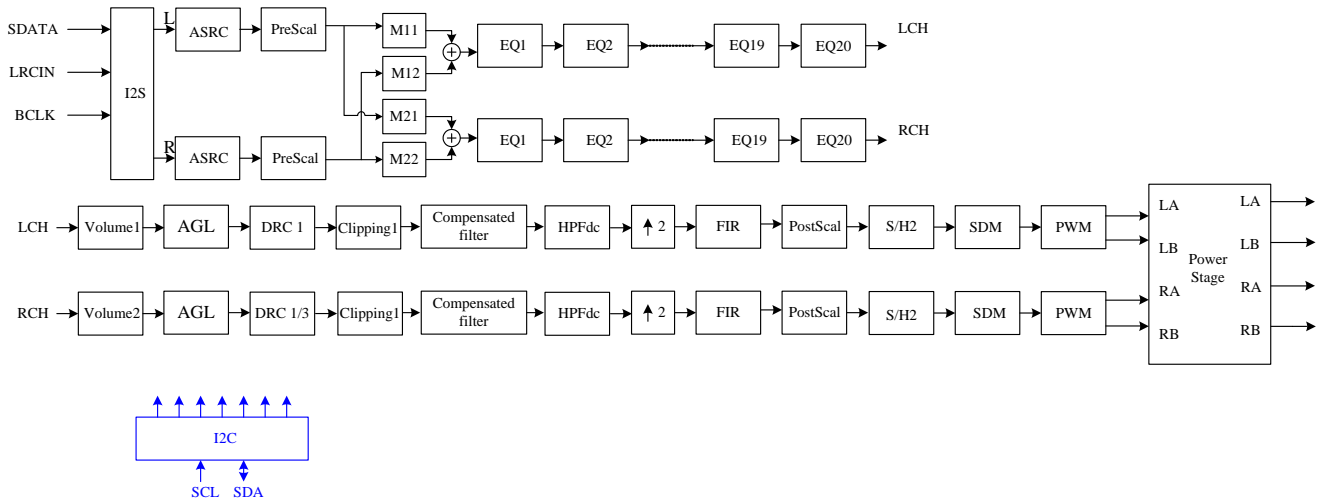

Each byte of SDA signaling must consist of 8 consecutive bits, and the byte is followed by an acknowledge bit. Data is transferred with MSB first, as shown in the figure below. In both write and read operations, AD82178 supports both single-byte and multi-byte transfers. Refer to the figure below for detailed data-transferring protocol.

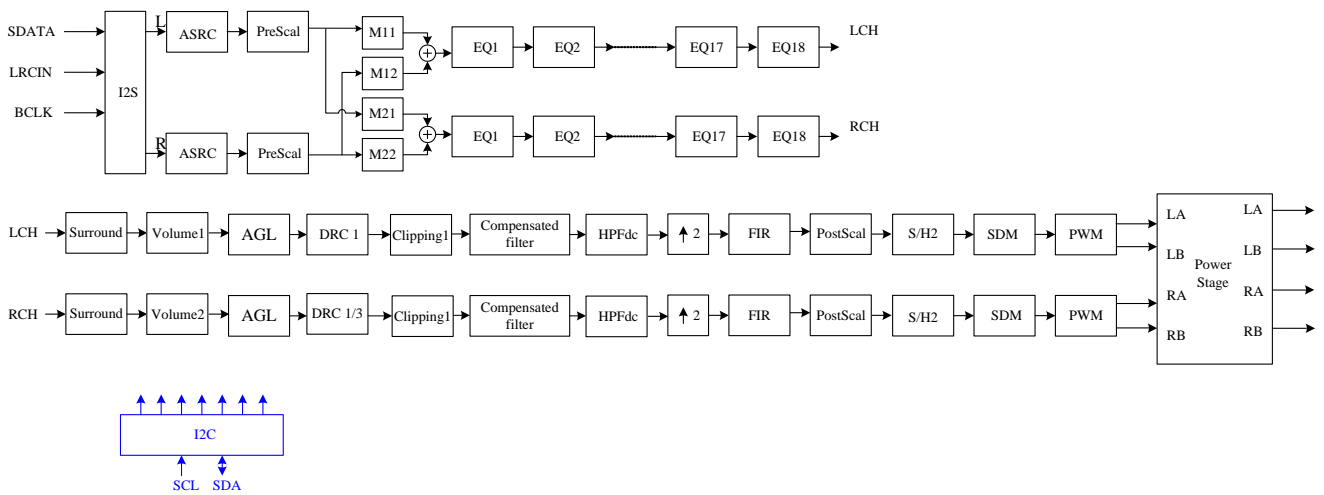

**Register Table**

The AD82178’s audio signal processing data flow is shown below. User can control these functions by programming appropriate settings in the register table. In this section, the register table is summarized first. The definition of each register follows in the next section.

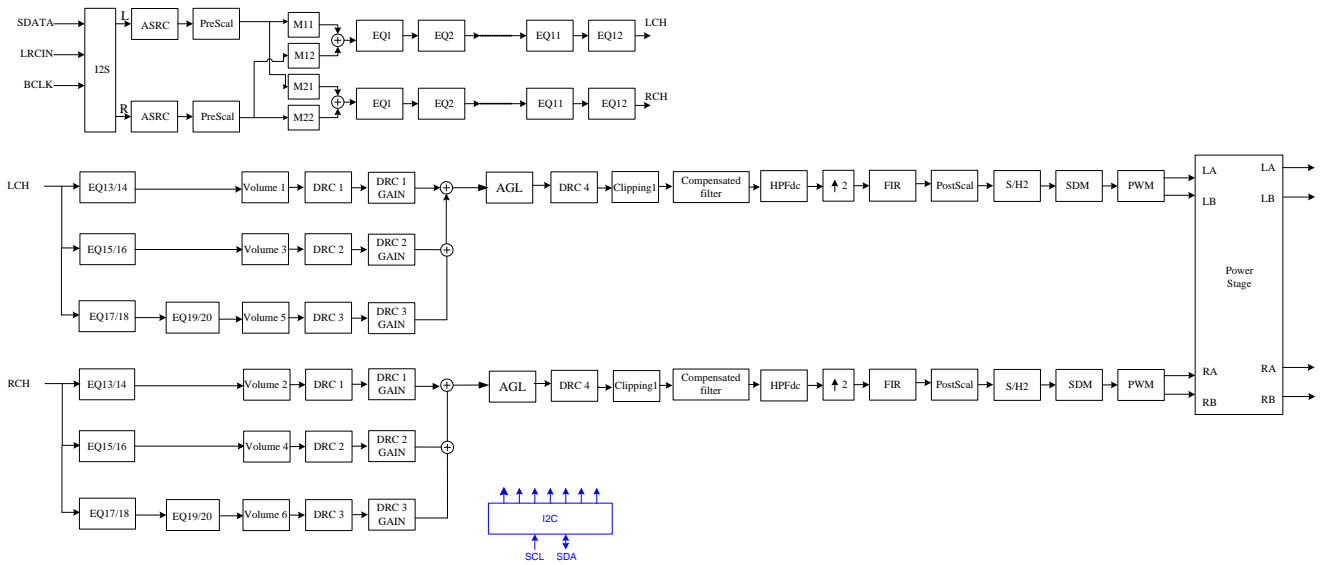

**Audio Processing 1 : One band DRC without SRS**

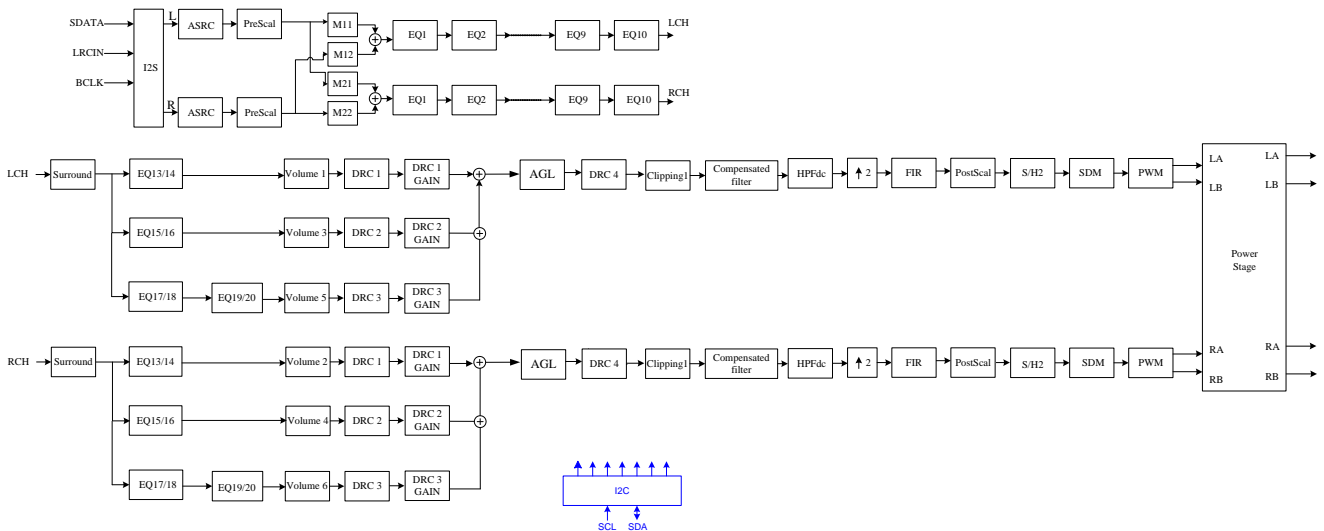

**Audio Processing 2 : One band DRC with SRS**

### Audio Processing 3 : Three band DRC without SRS

### Audio Processing 4 : Three band DRC with SRS

## Detail Description for Register

Note that the highlighted columns are default values of these tables. If there is no highlighted value, the default setting of this bit is determined by the external pin.

- Address 0X00 : State control 1

AD82178 supports multiple serial data input formats including I<sup>2</sup>S, Left-alignment and Right-alignment.

These formats are selected by user via bit7~bit5 of address 0X00. The left/right channels can be exchanged to each other by programming to address 0/bit0, LREXC.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7:5]	IF[2:0]	Input Format	000	I <sup>2</sup> S 16-24 bits
			001	Left-alignment 16-24 bits
			010	Right-alignment 16 bits
			011	Right-alignment 18 bits
			100	Right-alignment 20 bits
			101	Right-alignment 24 bits
B[4]		Reserved		
B[3]	PWML_X	LA/LB exchange	0	No exchanged
			1	Exchanged
B[2]	PWMR_X	RA/RB exchange	0	Exchanged
			1	No exchanged
B[1]	LV_UVSEL	LV under voltage selection	0	1.35V
			1	2.7V
B[0]	LREXC	Left/Right (L/R) Channel exchanged	0	No exchanged
			1	L/R exchanged

● Address 0X01 : State control 2

AD82178 has a built-in PLL and supports multiple MCLK/Fs or BCLK/Fs ratios.

If BCLK\_SEL is high, the ratio is changed to BCLK/FS ratios.

On the contrary, the ratio is changed to MCLK/FS ratios.

Detail setting is shown in the following table.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7]	BCLK_SEL	MCLK-less (BCLK system)	0	Disable
			1	Enable
B[6:5]	FS[1:0]	Sampling Frequency	00	32/44.1/48kHz
			01	64/88.2/96kHz
			10	8kHz
			11	16kHz
B[4]		Reserved		

Multiple MCLK/FS in MCLK system or BCLK/FS in BCLK system ratio setting table

BIT	NAME	DESCRIPTION	VALUE	B[5:4]=00	B[5:4]=01	B[5:4]=10	B[5:4]=11
B[3:0]	PMF[3:0]	MCLK/Fs or BCLK/Fs setup when PLL is not bypassed	0000	32X	32X	32X	32X

			1000	512X	512X	512X	512X

● Address 0X02 : State control 3

AD82178 has mute function including master mute and channel mute.

In one band DRC, master, channel 1, and channel 2 mute will active.

When master mute is enabled, all 2 processing channels are muted. User can mute these 2 channels individually by channel mute. When the mute function is enabled or disabled, the fade-out or fade-in process will be initiated.

In three bands DRC, master, channel 1 to channel 6 mute will active.

When master mute is enabled, all 6 processing channels are muted. User can mute these 6 channels individually by channel mute. When the mute function is enabled or disabled, the fade-out or fade-in process will be initiated.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7]	EN_CLK_OUT	PLL Clock Output	0	Disabled
			1	Enabled
B[6]	MMUTE	Master Mute	0	All channel not muted
			1	All channel muted
B[5]	CM1	Channel 1 Mute	0	Ch1 not muted
			1	Only Ch1 muted

			1	Only Ch4 muted
B[1]	CM5	Channel 5 Mute	0	Ch5 not muted
			1	Only Ch5 muted
B[0]	CM6	Channel 6 Mute	0	Ch6 not muted
			1	Only Ch6 muted

● Address 0X03 : Master volume control

AD82178 supports both master-volume (Address 0X03) and channel-volume control (Address 0X04, 0X05, 0X06, 0X07, 0X08, 0X09) modes. Both volume control settings range from +12dB ~ -103dB and 0.5dB per step. Note that the master volume control is added to the individual channel volume control as the total volume control. For example, if the master volume level is set at, Level A (in dB unit) and the channel volume level is set at Level B (in dB unit), the total volume control setting is equal to Level A plus with Level B.

$$-103\text{dB} \leq \text{Total volume ( Level A + Level B )} \leq +24\text{dB}.$$

			1	Enable
B[1]	CKDET_SEL	Select A_CKDET or D_CKDET	0	D_CKDET
			1	A_CKDET
B[0]	RECOUNT_EN	ASRC RECOUNT EN	0	Disable
			1	Enable

Hereunder is AD82178's changing FS sequence.

- Address 0X18 : Dynamic Temperature Control (DTC)

AD82178 supports dynamic temperature control. The table describes the setting of DTC.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7]	DTC_EN	DTC Enable	0	Disable
			1	Enable
B[6:5]	DTC_TH	DTC Threshold	00	110 °C
			01	120 °C
			10	130 °C
			11	140 °C
B[4:3]	DTC_RATE	DTC Attack and Release Rate	00	1dB/sec
			01	0.5dB/sec
			10	0.33dB/sec
			11	0.25dB/sec
B[2:0]	X	Reserved		

Release threshold is always 10 °C smaller than attack threshold.

For example:

DTC threshold (attack threshold) =130 °C, the release threshold = 120 °C.

DTC threshold (attack threshold) =120 °C, the release threshold = 110 °C.

If junction temperature (T<sub>j</sub>) exceeds 130 °C, amplifier gain will be lowered to timing of 1dB/sec. If amplifier gain falls and junction temperature (T<sub>j</sub>) turns into less than 130 °C and larger than 120 °C, the gain will not increase or decrease. If amplifier gain falls and junction temperature (T<sub>j</sub>) turns into less than 120 °C, amplifier gain will be raised to timing of 1dB/sec.

			101	18.2V
			Others	6.7V

- Address 0X1C: State control 7

The I<sup>2</sup>C device number can select 2 or 4 address in B[7].

The ERROR pin of AD82178 is a dual function pin. It is treated as a I<sup>2</sup>C device address selection input when B[6] is set as low. It will become as an ERROR output pin when B[6] is set as high.

AD82178 can turn on delta quaternary modulation via bit 5.

AD82178 provide 2 kind of fade in/out speed via bit 2. One is 1.25ms from mute to 0dB. The other one is 10ms from mute to 0dB.

AD82178 provide noise gate function if receiving 2048 signal sample points smaller than noise gate attack level. User can change noise gate gain via bit1~ bit0. When noise gate function occurs, input signal will multiply noise gate gain (x1/8, x1/4 x1/2, x0). User can select fade out or not via bit 4.

BIT	NAME	DESCRIPTION	VALUE	FUNCTION
B[7]	DEV_NUM	Device address number	0	2 address
			1	4 address

● Address 0X3A : First byte of C1 level meter

In one band DRC, channel-1 level meter is used for L channel.

In three bands DRC, channel-1 level meter is high frequency path of L channel.

The addresses to show channel-1 level meter are 0X3A, 0X3B, 0X3C, and 0X3D.

● Address 0X67 : Power saving mode switching level

If the PWM exceeds the programmed switching power level (default 20\*40ns), the modulation algorithm will change from default modulation scheme into power saving mode scheme. It results in higher power efficiency during larger power output operations. If the PWM drops below the programmed switching power level - programmed switching window (default (20-5)\*40ns), the modulation algorithm will change back to default modulation scheme.

Switching scheme is related to QT\_EN (address0X1A, B[1]), D\_MOD (address0X1C, B[5]), QD\_EN (address0X1C, B[3]), and DUTY\_PWM\_EN (address0X1A, B[7]).

AD82178 has three type switching schemes and they share the same switching scheme.

One time will only have one switching scheme.

Case1: QT\_EN =1, D\_MOD =0, QD\_EN=0, DUTY\_PWM\_EN =0

The default modulation scheme is quaternary and power saving mode scheme is ternary.

Case2: QT\_EN =1, D\_MOD =1, QD\_EN =0, DUTY\_PWM\_EN =0.

The default modulation scheme is delta quaternary and power saving mode scheme is ternary.

Case3: QT\_EN =1, D\_MOD =0, QD\_EN =0, DUTY\_PWM\_EN =1.

The default modulation scheme is advance quaternary and power saving mode scheme is ternary.

Case4: QT\_EN =0, D\_MOD =0, QD\_EN=1, DUTY\_PWM\_EN =0.

The default modulation scheme is quaternary and power saving mode scheme is delta quaternary.

**RAM access**

The procedure to read/write coefficient(s) from/to RAM is as followings:

**Read a single coefficient from RAM:**

1. Write 7-bis of address to I<sup>2</sup>C address-0X1D
2. Write 1 to R1 bit and write 1/0 to RBS in address-0X32
3. Read first byte of coefficient in I<sup>2</sup>C address-0X1E
4. Read second byte of coefficient in I<sup>2</sup>C address-0X1F
5. Read third byte of coefficient in I<sup>2</sup>C address-0X20
6. Read fourth byte of coefficient in I<sup>2</sup>C address-0X21

**Read a set of coefficients from RAM:**

1. Write 7-bits of address to I<sup>2</sup>C address-0X1D
2. Write 1 to RA bit and write 1/0 to RBS in address-0X32
3. Read first byte of coefficient A1 in I<sup>2</sup>C address-0X1E
4. Read second byte of coefficient A1 in I<sup>2</sup>C address-0X1F
5. Read third byte of coefficient A1 in I<sup>2</sup>C address-0X20
6. Read fourth byte of coefficient A1 in I<sup>2</sup>C address-0X21
7. Read first byte of coefficient A2 in I<sup>2</sup>C address-0X22
8. Read second byte of coefficient A2 in I<sup>2</sup>C address-0X23
9. Read third byte of coefficient A2 in I<sup>2</sup>C address-0X24
10. Read fourth byte of coefficient A2 in I<sup>2</sup>C address-0X25
11. Read first byte of coefficient B1 in I<sup>2</sup>C address-0X26
12. Read second byte of coefficient B1 in I<sup>2</sup>C address-0X27
13. Read third byte of coefficient B1 in I<sup>2</sup>C address-0X28
14. Read fourth byte of coefficient B1 in I<sup>2</sup>C address-0X29
15. Read first byte of coefficient B2 in I<sup>2</sup>C address-0X2A
16. Read second byte of coefficient B2 in I<sup>2</sup>C address-0X2B
17. Read third byte of coefficient B2 in I<sup>2</sup>C address-0X2C
18. Read fourth byte of coefficient B2 in I<sup>2</sup>C address-0X2D
19. Read first byte of coefficient A0 in I<sup>2</sup>C address-0X2E
20. Read second byte of coefficient A0 in I<sup>2</sup>C address-0X2F
21. Read third byte of coefficient A0 in I<sup>2</sup>C address-0X30
22. Read fourth byte of coefficient A0 in I<sup>2</sup>C address-0X31

**Write a single coefficient from RAM:**

1. Write 7-bis of address to I<sup>2</sup>C address-0X1D
2. Write first byte of coefficient in I<sup>2</sup>C address-0X1E
3. Write second byte of coefficient in I<sup>2</sup>C address-0X1F
4. Write third byte of coefficient in I<sup>2</sup>C address-0X20
5. Write fourth byte of coefficient in I<sup>2</sup>C address-0X21
6. Write 1 to W1 bit and write 1/0 to RBS in address-0X32

**Write a set of coefficients from RAM:**

1. Write 7-bits of address to I<sup>2</sup>C address-0X1D
2. Write first byte of coefficient A1 in I<sup>2</sup>C address-0X1E
3. Write second byte of coefficient A1 in I<sup>2</sup>C address-0X1F
4. Write third byte of coefficient A1 in I<sup>2</sup>C address-0X20
5. Write fourth byte of coefficient A1 in I<sup>2</sup>C address-0X21
6. Write first byte of coefficient A2 in I<sup>2</sup>C address-0X22
7. Write second byte of coefficient A2 in I<sup>2</sup>C address-0X23
8. Write third byte of coefficient A2 in I<sup>2</sup>C address-0X24
9. Write fourth byte of coefficient A2 in I<sup>2</sup>C address-0X25
10. Write first byte of coefficient B1 in I<sup>2</sup>C address-0X26
11. Write second byte of coefficient B1 in I<sup>2</sup>C address-0X27
12. Write third byte of coefficient B1 in I<sup>2</sup>C address-0X28
13. Write fourth byte of coefficient B1 in I<sup>2</sup>C address-0X29
14. Write first byte of coefficient B2 in I<sup>2</sup>C address-0X2A
15. Write second byte of coefficient B2 in I<sup>2</sup>C address-0X2B
16. Write third byte of coefficient B2 in I<sup>2</sup>C address-0X2C
17. Write fourth byte of coefficient B2 in I<sup>2</sup>C address-0X2D
18. Write first byte of coefficient A0 in I<sup>2</sup>C address-0X2E
19. Write second byte of coefficient A0 in I<sup>2</sup>C address-0X2F
20. Write third byte of coefficient A0 in I<sup>2</sup>C address-0X30
21. Write fourth byte of coefficient A0 in I<sup>2</sup>C address-0X31
22. Write 1 to WA bit and write 1/0 to RBS in address-0X32

*Note that: the read and write operation on RAM coefficients works only if LRCIN switching on rising edge. And, before each writing operation, it is necessary to read the address-0X32 to confirm whether RAM is writable current in first. If the logic of W1 or WA is high, the coefficient writing is prohibited.*

- User-defined equalizer

The AD82178 provides 40 parametric Equalizer (EQ). User can program suitable coefficients via I<sup>2</sup>C control interface to program the required audio band frequency response for every EQ. The transfer function

$$H(z) = \frac{A_0 + A_1z^{-1} + A_2z^{-2}}{1 + B_1z^{-1} + B_2z^{-2}}$$

The data format of 2's complement binary code for EQ coefficient is 3.25. i.e., 3-bits for integer (MSB is the sign bit) and 25-bits for mantissa. Each coefficient range is from 0x8000000 (-4) to 0x7FFFFFFF (+3.99999997). These coefficients are stored in User Defined RAM and are referenced in following manner:

$$CHxEQyA0 = A0$$

$$CHxEQyA1 = A1$$

$$CHxEQyA2 = A2$$

$$CHxEQyB1 = -B1$$

$$CHxEQyB2 = -B2$$

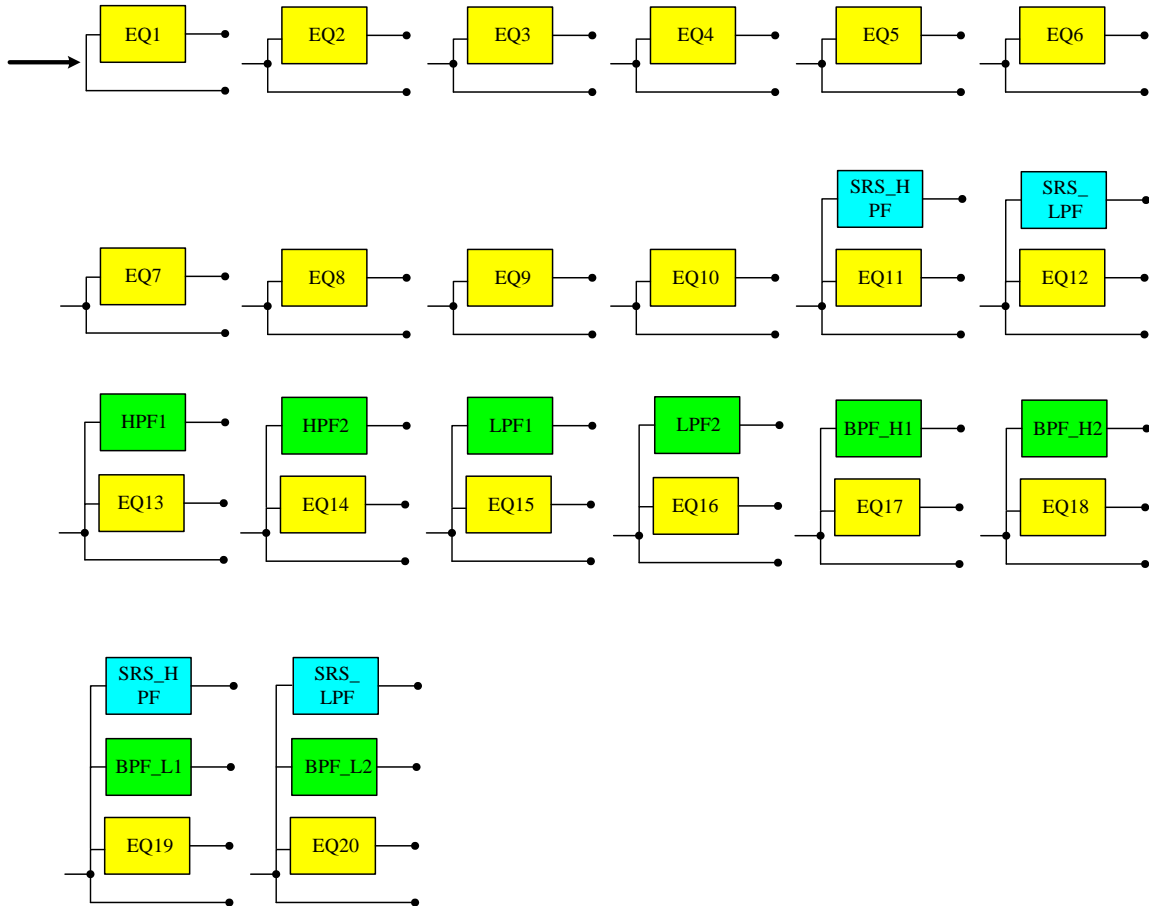

Where x and y represents the number of channel and the band number of EQ biquard.

All user-defined filters are path-through, where all coefficients are defaulted to 0 after being powered up, except the A0 that is set to 0x2000000 which represents 1.

● EQ arrangement

AD82178 provide 20 EQ per channel.

In three bands EQ-13, EQ-14, EQ-15, EQ-16, EQ-17, EQ-18, EQ-19 and EQ-20 will perform as HPF1/2, LPF1/2, BPF\_H1/2, and BPF\_L1/2 respectively.

Mixer

The AD82178 provides mixers to generate the extra audio source from the input left and right channels. The coefficients of mixers are defined in range from 0x800000 (-1) to 0x7FFFFFFF (0.9999998808). The function block diagram is as following:

- Pre-scale

For each audio channel, AD82178 can scale input signal level prior to EQ processing which is realized by a 28-bit signed fractional multiplier. The pre-scale factor, ranging from -16 (0x8000000) to 15.99999988 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the pre-scaling factors are set to 0x07e88e0. Programming of RAM is described in RAM access.

- Post-scale

The AD82178 provides an additional multiplication after equalizing and before interpolation stage, which is realized by a 28-bit signed fractional multiplier. The post-scaling factor, ranging from -4 (0x8000000) to 3.99999997 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the post-scaling factors are set to 0x2000000. All channels can use the channel-1 post-scale factor by setting the post-scale link. Programming of RAM is described in RAM access.

- Power clipping

The AD82178 provides power clipping function to avoid excessive signal that may destroy loud speaker. The power clipping level is defined by 28-bit representation and is stored in RAM address 0X70 of RAM bank 0. The following table shows the power clipping level's numerical representation.

Sample calculation for power clipping

Max amplitude	dB	Linear	Decimal	Hex (3.25 format)
PVDD	0	1	2097152	200_0000
PVDD*0.707	-3	0.707	1482686	169_FBE0
PVDD*0.5	-6	0.5	1048576	100_0000
PVDD*L	x	$L=10^{(x/20)}$	$D=2097152xL$	$H=dec2hex(D)$

- DRC threshold

The AD82178 provides DRC function. When the input average exceeds the programmable DRC threshold value, the output power will be limited by this threshold power level via gradual gain reduction. Four sets of DRC are provided. DRC1 is used for high frequency path in three bands DRC and used for L/R channel in one band DRC. DRC2 is used for low frequency path in three bands DRC. DRC3 is used for band pass frequency path in three bands DRC. DRC4 is used for the post DRC.

After AD82178 has reached the DRC threshold, its output power will be limited to that level. The output power level will be gradually adjusted to the programmable DRC threshold level. DRC threshold is defined by 28-bit presentation and is stored in RAM address 0X7A of RAM bank 0 and RAM address 0X70, 0X74, 0X78 of RAM bank 1.

The following table shows the DRC threshold's numerical representation. "T" is the threshold of DRC.

The equation is

$$T_{dB} = (T - 24) / 6.0206 \text{ (dB)}$$

Ex: T=-6 db, TdB=(-6-24)/6.0206=-4.982892(dB)

T<sub>Dec</sub>=-41799528

T<sub>Hex</sub>=0XD823098

$$Vp = PVDD * [10^{((T+4)/20)}]$$

Sample calculation for DRC threshold

Power	T	TdB	Decimal	Hex (5.23 format)
(Vp <sup>2</sup> )/2R	-4	-4.65	-39012893	DACB5E3
	-7	-5.149	-43192845	D6CEDF3
	X	(x-24)/6.0206	D=2 <sup>23</sup> *TdB	H=dec2hex(D)

- **DRC slope**

The AD82178 DRC provides limiter and compressor. Using slope to decide compression factor. The relationship between the ratio R and the slope S is

$$S = 1 - \frac{1}{R}$$

$$R = \frac{1}{1 - S} = \frac{x - \text{Threshold(dB)}}{y - \text{Threshold(dB)}}$$

DRC slope is defined by 28bit and is stored in RAM address 0x7B of RAM bank 0 and RAM address 0X71, 0X75, 0X79 of RAM bank 1.

Ex: Setting DRC is limiter, S=1 (R=∞).

S\_DEC=1\*2<sup>25</sup> = 33554432

S\_HEX = 0X2000000

● **Noise Gate Attack Level**

When both left and right signals have 2048 consecutive sample points less than the programmable noise gate attack level, the audio signal will multiply noise gate gain, which can be set at x1/8, x1/4, x1/2, or zero if the noise gate function is enabled. Noise gate attack level is defined by 28-bit representation and is stored in RAM address 0X71 of RAM bank 0.

● **Noise Gate Release Level**

After entering the noise gating status, the noise gain will be removed whenever AD82178 receives any input signal that is more than the noise gate release level. Noise gate release level is defined by 28-bit representation and is stored in RAM address 0X72 of RAM bank 0. The following table shows the noise gate attack and release threshold level's numerical representation.

Sample calculation for noise gate attack and release level

Input amplitude (dB)	Linear	Decimal	Hex (1.27 format)
0	1	8388607	7FFFFFF0
-100	$10^{-5}$	83	530
-110	$10^{-5.5}$	26	1A0
x	$L=10^{(x/20)}$	$D=8388607 \times L$	$H=\text{dec2hex}(D)$

● **DRC Energy Coefficient**

The above figure illustrates the digital processing of calculating RMS signal power. In this processing, a DRC energy coefficient is required, which can be programmed for different frequency range. Four sets of energy coefficients are provided and used for respective DRC. Energy coefficient is defined by 28-bit representation and is stored in RAM address 0X73, 0X74, 0X75, and 0X76 of RAM bank 0. The following table shows the DRC energy coefficient numerical representation.

Sample calculation for DRC energy coefficient

DRC energy coefficient	dB	Linear	Decimal	Hex (1.27 format)
1	0	1	8388607	7FFFFFF0
1/256	-48.2	1/256	32768	80000
1/1024	-60.2	1/1024	8192	20000
L	x	$L=10^{(x/20)}$	$D=8388607 \times L$	$H=\text{dec2hex}(D)$

## The user defined RAM

The contents of user defined RAM is represented in following table.

## Package Dimensions

- E-TSSOP 24L (173mil)

Symbol	Dimension in mm	
	Min	Max
A	1.00	1.20
A1	0.00	0.15
b	0.19	0.30
c	0.09	0.20
D	7.70	7.90
E	4.30	4.50
E1	6.30	6.50
e	0.65 BSC	
L	0.45	0.75

### Exposed pad

Option 1	Dimension in mm	
	Min	Max
D2	3.95	4.75
E2	2.70	3.10

**Revision History**

<b>Revision</b>	<b>Date</b>	<b>Description</b>
0.1	2023.06.28	Original.
0.2	2023.08.14	1. Added instantaneous output power specification. 2. Modified VREG from 1.8V to 1.5V.
1.0	2023.09.01	Remove "Preliminary" to V1.0
1.1	2023.10.12	1. Modify the description of Power clipping and DRC threshold. 2. Modify the default value of AGL ATH and AGL RTH in the user defined RAM.
1.2	2024.03.25	Adding a changing FS sequence in the description of 0x17.
1.3	2024.07.04	1. Adding a note for Power on sequence. 2. Modifying a typo in Power clipping.

Any semiconductor devices may have inherently a certain rate of failure. To minimize risks associated with customer's application, adequate design and operating safeguards against injury, damage, or loss from such failure, should be provided by the customer when making application designs.

ESMT's products are not authorized for use in critical applications such as, but not limited to, life support devices or system, where failure or abnormal operation may directly affect human lives or cause physical injury or property damage. If products described here are to be used for such kinds of application, purchaser must do its own quality assurance testing appropriate to such applications.
