Product Description

The AH103A is a high gain, high linearity 1/2-Watt amplifier. This device is comprised of two individual MMIC amplifiers internally and can be used with an external interstage match for any of the mobile infrastructure frequency bands. The dual-stage amplifier achieves up to +46 dBm IP3 performance with 29 dB gain.

The device conforms to WJ Communications' long history of producing high reliability and quality components. The AH103A has an associated MTTF of a minimum of 100 years at a mounting temperature of 85 °C and is housed in a lead-free /green/RoHS-compliant SOIC-8 package. All devices are 100% RF & DC tested.

The product is targeted for use as driver amplifiers for wireless infrastructure where high performance and high linearity are required.

Notes:

1. A voltage regulator is used in this circuit (U2) to drop the +9 V to a +5 V usable supply for the first internal amplifier. It is permissible to remove the regulator and operate the 1st amplifier stage directly off of +5 V supply onto Test Point 1 (TP1). The use of a +5 V supply on the 1st amplifier stage requires a dropping resistor of 6.8 Ω. A +4.5 V supply can also be used to bypass the 6.8 Ω and can be applied to Test Point 2 (TP2).

Functional Pin Layout

Pin	Function
1	Amp2 input
2	Amp1 output / Bias Amp1
3, 5, 8	Ground
4	RF input (Amp1 input)
6	RF output (Amp2 output)
7	Bias Amp2

The backside paddle is the Source and should be grounded for thermal and electrical purposes. All other pins should be grounded on the PCB.

Mounting Config. Notes

- Ground / thermal vias are critical for the proper performance of this device. Vias should use a .35mm (#80 / .0135") diameter drill and have a final plated through diameter of .25 mm (.010").
- Add as much copper as possible to inner and outer layers near the part to ensure optimal thermal performance.
- To ensure reliable operation, device ground paddle-to-ground pad solder joint is critical.
- Add mounting screws near the part to fasten the board to a heatsink. Ensure that the ground / thermal via region contacts the heatsink.
- For optimal thermal performance, expose soldermask on backside where it contacts the heatsink.
- RF trace width depends upon the PC board material and construction.
- Use 1 oz. Copper minimum.
- All dimensions are in millimeters. Angles are in degrees.
- A heatsink underneath the area of the PCB for the mounted device is strictly required for proper thermal operation. Damage to the device can occur without the use of one.

Thermal Specifications

Parameter	Rating
Operating Case Temperature	-40 to +85°C
Thermal Resistance ⁽¹⁾ , R _{th}	20.6°C / W
Junction Temperature ⁽²⁾ , T _j	129°C

- The thermal resistance is referenced from the hottest part of the junction to the ground paddle underneath the device.
- This corresponds to the typical biasing condition of +4.5V, 75mA on pin 1 and 9V, 200 mA on pins 6, 7 at an 85°C case temperature. A minimum MTTF of 1 million hours is achieved for junction temperatures below 160°C.
