AK4708

AV SCART Switch with Two RGB Outputs

GENERAL DESCRIPTION

The AK4708 is an IIC controlled audio and video switch matrix designed for digital TV and set-top-box applications. The AK4708 offers the ideal features for digital set-top-box systems. The AK4708 includes the audio switches, video switches, video filters. The AK4708 provides high performance audio and video routings to meet dual SCART connections. The AK4708 is supplied in a small 48-pin LQFP package to contribute space saving in PCB.

FEATURES

Analog Switches for SCART

Audio section

THD+N: -86dB (@2Vrms)

Dynamic Range: 96dB (@2Vrms)

Analog Inputs

Two Full Differential Stereo Inputs or Single-ended input for Decoder DAC

Two Stereo Inputs (TV & VCR SCART)

Analog Outputs

Two Stereo Outputs (TV & VCR SCART)

Stereo Analog Volume with Pop-noise Free Circuit (+6dB to -60dB & Mute)

Pop Noise Free Circuit for Power on/off

Video section

VCR SCART supports RGB mode

Integrated LPF: -40dB @27MHz

75Ω driver

6dB Gain for Outputs

Four CVBS/Y inputs (ENCx2, TV, VCR), Two CVBS/Y outputs (TV, VCR)

Three R/C inputs (ENCx2, VCR), Two R/C outputs (TV, VCR)

Two G and B inputs (ENC, VCR), Two G and B outputs (TV, VCR)

TV/VCR input monitor

Loop-through Mode for standby

Auto-Startup Mode for power saving

SCART pin#16 (Fast Blanking), pin#8 (Slow Blanking) Control

Power supply

5V+/-5% and 12V+/-10%

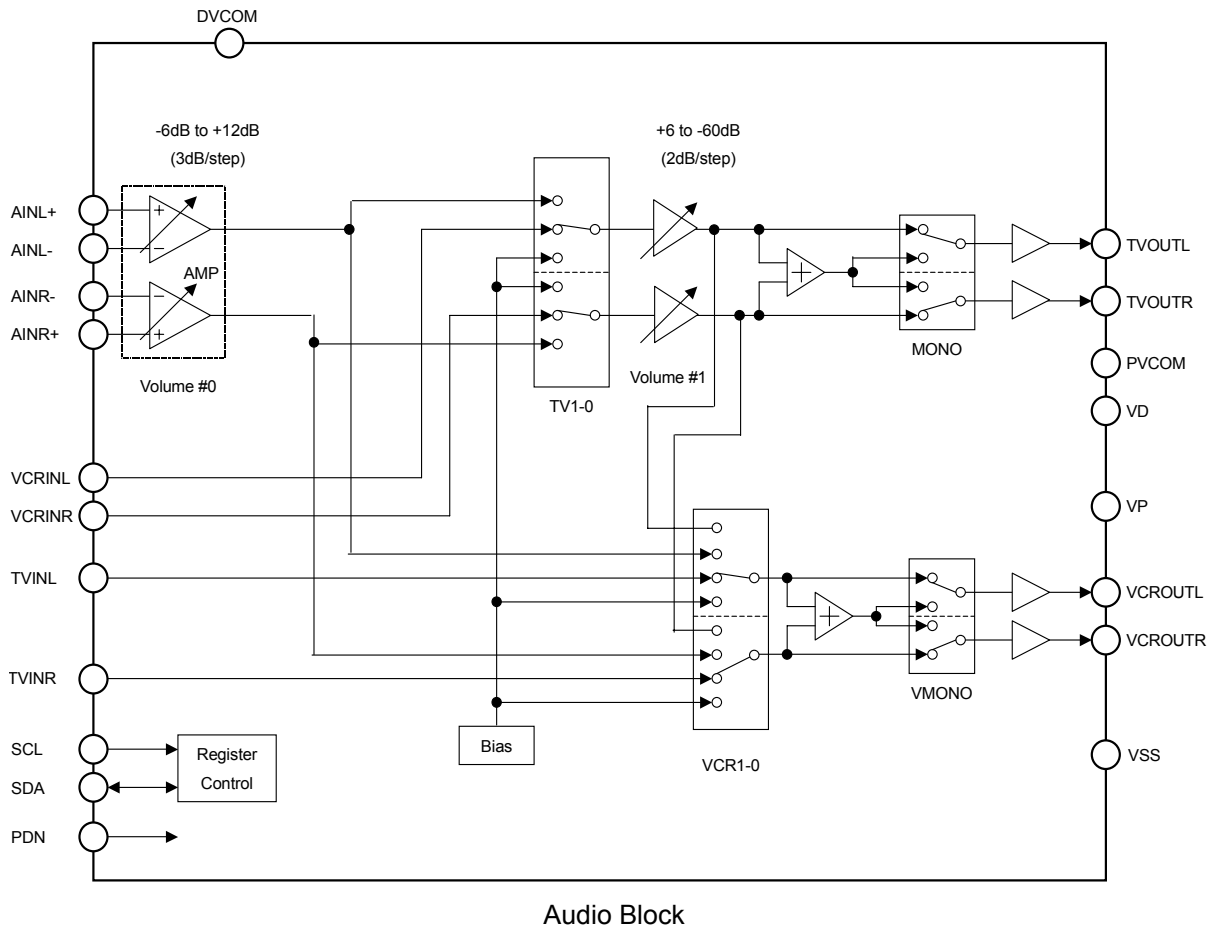

Small current consumption in Standby Mode

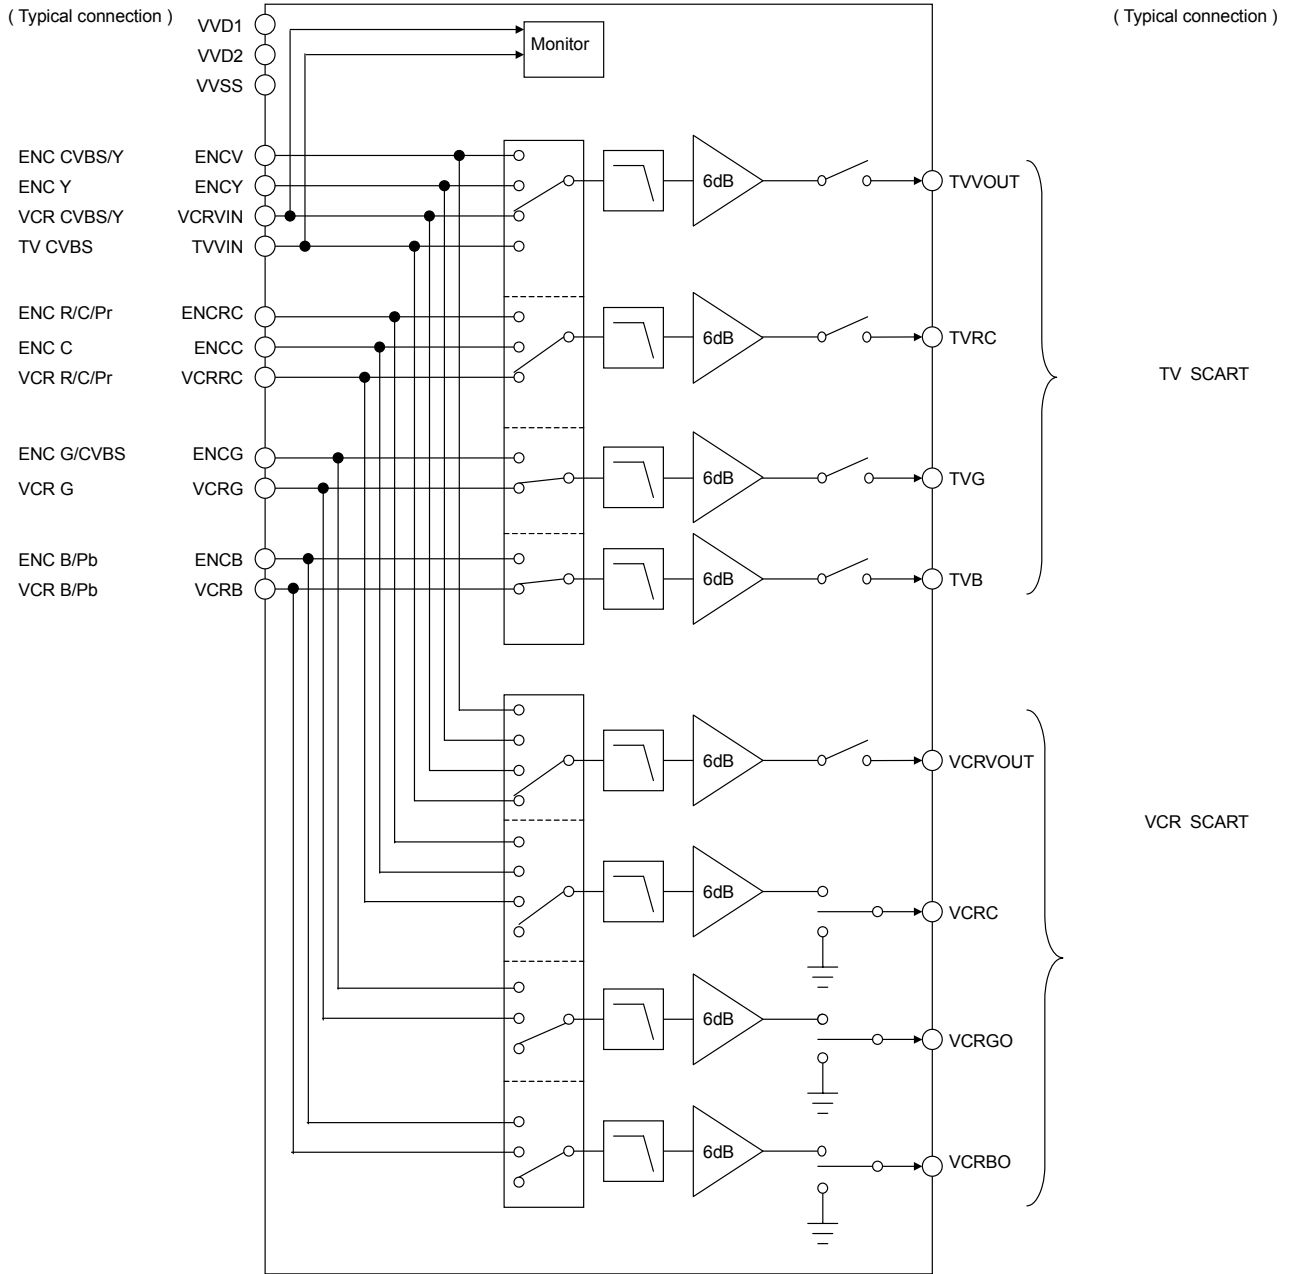

(VD=10μA typ., VVD1+VVD2=10μA typ., VP=10μA typ.)

Package

OPERATION OVERVIEW

1. System Reset and Power-down options

The AK4708 should be reset once by bringing PDN pin = “L” upon power-up. The AK4708 has several operation modes. The PDN pin, AUTO bit, BIAS bit, STBY bit and AMP bit control operation modes as shown in Table 1 and Table 2.

Mode	PDN pin	AUTO bit	STBY bit	BIAS bit	Mode
0	“L”	x	x	x	Full Power-down
1	“H”	1	x	x	Auto Startup mode (Power-on default)
2	“H”	0	1	1	Standby & Mute
3	“H”	0	1	0	Standby
4	“H”	0	0	1	Mute (AMP power down)
5	“H”	0	0	0	Normal operation (AMP operation)

Table 1. Operation Mode Settings (x: Don't Care)

Mode		Register Control	Audio Bias Level	Video Output	TVFB TVSB VCRFBO	VCRSB
0	Full Power-down	NOT available	Power down	Hi-Z	Hi-Z	Pull-down (Note 17)
1	Auto Startup mode (Power-on default)	Available				
			Video input (Note 18)	Power down		
2	Standby & mute		Active	Hi-Z/ Active		
3	Standby		Power down			
4	Mute (AMP power down)		Active (Note 19)			
5	Normal operation (AMP operation)

Table 2. Status of each operation modes

■ System Reset and Full Power-down Mode

The AK4708 should be reset once by bringing PDN pin = “L” upon power-up.

PDN pin: Power down pin

L: Device power down & reset

H: Normal operation.

■ Auto Startup Mode

After when the PDN pin is set to “H”, the AK4708 is in the auto startup mode. In this mode, all blocks except for the video detection circuit are powered down. Once the video detection circuit detects video signal from TVVIN pin or VCRVIN pin, the AK4708 goes to the stand-by mode automatically and sends “H” pulse via INT pin. The sources of TVOUTL/R are fixed to VCRINL/R, the sources of VCROUTL/R are fixed to TVINL/R respectively. The source of DC- restore circuit is VCRVIN pin. To exit the auto startup mode, set the AUTO bit to “0”.

AUTO bit (00H D3): Auto startup bit

0: Auto startup disable. (Manual startup)

1: Auto startup enable. (default)

■ Bias Mode

When the BIAS bit = “1”, the bias voltage on the audio output goes to GND level. Bringing BIAS bit to “0” changes this bias voltage smoothly from GND to VP/2 by 2sec (typ.). This removes the huge click noise related the sudden change of bias voltage at power-on. The change of BIAS bit from “1” to “0” also makes smooth transient from VP/2 to GND by 2sec (typ.). This removes the huge click noise related the sudden change of bias voltage at power-off.

BIAS bit (00H D1): Bias-off bit

0: Normal operation.

1: Set the audio bias to GND. (default)

■ Standby Mode

When the AUTO bit = BIAS bit = “0” and the STBY bit = “1”, the AK4708 is forced into TV-VCR loop through mode. In this mode, the sources of TVOUTL/R pins are fixed to VCRINL/R pins; the sources of VCROUTL/R are fixed to TVINL/R pins respectively. All register values themselves are NOT changed by STBY bit = “1”.

STBY bit (00H D0): Standby bit

0: Normal operation.

1: Standby mode. (default)

■ Normal Operation Mode

To change analog switches, set the AUTO bit, BIAS bit and STBY bit to “0”. The AK4708 is in power-down mode until PDN pin = “H”. The Figure 4 shows an example of the system timing at the power-down and power-up by PDN pin.

■ Typical Operation Sequence (auto setup mode)

The Figure 4 shows an example of the system timing at auto startup mode.

Figure 4. Auto startup mode sequence

■ Typical Operation Sequence (except auto setup mode)

Figure 5 shows an example of the system timing at normal operation mode.

Note 21. Set the STBY bit = “0” to pass for 20.2ms after set the VMUTE bit = “0”, to prevent the click noise.

Note 22. Mute the analog outputs externally if click noise affects the system.

■ Switch Control

The AK4708 has switch matrixes designed primarily for SCART routing. Those are controlled via the control register as shown in, Table 3 and Table 4 (Please refer to the Block Diagram).

■ Volume Control #0 (7-Level Volume)

The AK4708 has a 7-level volume control (Volume #0) as shown in Table 5. The volume reflects the change of register value immediately.

1	0	0	0	1	0	+6dB

0	0	0	0	0	1	-60dB
0	0	0	0	0	0	Mute

(default)

Note: The output must not exceed 3Vrms.

Table 7. Volume #1

When the MOD bit = "1"(default), changing levels don't have pop noise. MDT1-0 bits select the transition time (Table 8). When the new gain value 1EH(-2dB) is written to gain resistor while the actual (stable) gain is 1FH(0dB), the gain changes to 1EH(-2dB) within the transition time selected by MDT1-0 bits. The AK4708 compares the actual gain to the value of gain register after finishing the transition time, and re-changes the actual gain to new resistor value within the transition time if the register value is different from the actual gain when compared. When the MOD bit = "0" then there is no transition time and the gain changes immediately. This change may cause a click noise.

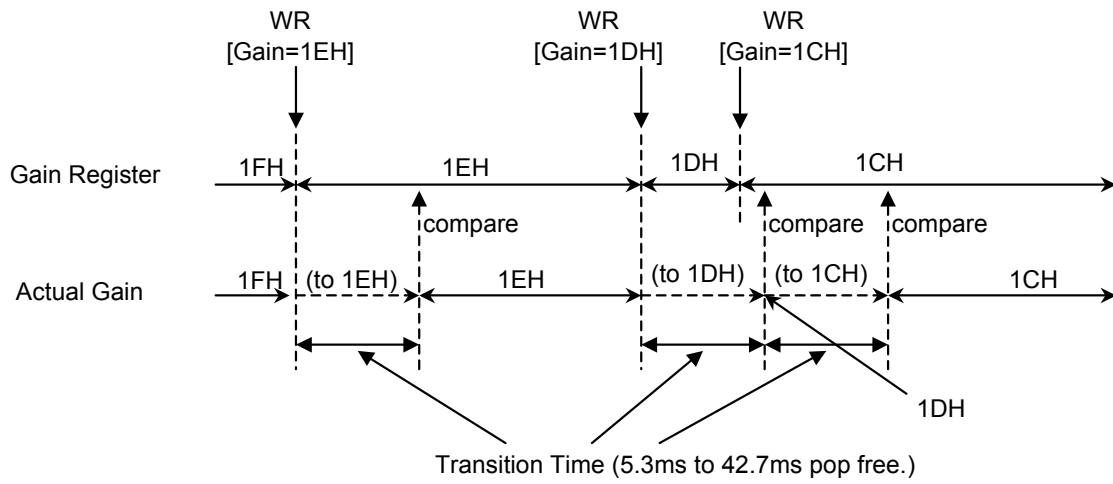

Figure 8. Volume Change Operation (MOD bit = "1")

MDT1	MDT0	Transition Time
0	0	5.3ms
0	1	10.7ms
1	0	21.3ms
1	1	42.7ms

■ Video Switch Control

The AK4708 has switches for TV and VCR. Each switch can be controlled via registers independently. When AUTO bit = "1" or STBY bit = "1", these switches setting is ignored and set to fixed configuration (loop-through mode). Please refer the auto startup mode and standby mode.

■ Clamp and DC-restore circuit control (06H: D7-D2)

Each CVBS and Y input has the sync tip clamp circuit. The DC-restore circuit has two clamp voltages 0.7V(typ) and 2.2V(typ) to support both RGB and YPbPr signal. They correspond to 0.35V(typ) and 1.1V(typ) at the SCART connector when matched by 75Ω resistors. The CLAMP1, CLAMP0 and CLAMPB bits select the input circuit for ENCRC pin (Encoder Red/Chroma), ENCB pin (Encoder Blue), VCRRC pin (VCR Red/Chroma) and VCRB pin (VCR Blue) respectively. VCLP2-0 bits select the sync source of DC- restore circuit.

5. Monitor Options and INT function

■ Monitor Options (08H: D4-D0)

The AK4708 has several detection functions. SVCR1-0 bits, FVCR bit, VCMON bit and TVMON bit reflect the input DC level of VCR slow blanking, the input DC level of VCR fast blanking and signals input to TVVIN or VCRVIN pins.

SVCR1-0: VCR Slow blanking status monitor

SVCR1-0 bits reflect the voltage at VCRSB pin only when the VCRSB is in the input mode.
When the VCRSB is in the output mode, SVCR1-0 bits hold previous value.

■ INT Function and Mask Options (09H: D3-D1)

Changes of the 08H status can be monitored via the INT pin. The INT pin is the open drain output and goes “L” for 2 μ s (typ.) when the status of 08H is changed. This pin should be connected to VD (typ. 5V) through 10k Ω resistor or lower voltage through 10k Ω resistor. MTV bit, MVC bit, MCOMN bit, MFVCR bit and MSVCR bit control the reflection of the status change of these monitors onto the INT pin from report to prevent to masks each monitor.

6. Control Interface

I²C-bus Control Mode

1. WRITE Operations

Figure 14 shows the data transfer sequence in I²C-bus mode. All commands are preceded by a START condition. A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition (Figure 20). After the START condition, a slave address is sent. This address is 7bits long followed by the eighth bit that is a data direction bit (R/W). The most significant seven bits of the slave address are fixed as “0010001”. If the slave address match that of the AK4708, the AK4708 generates the acknowledge and the operation is executed. The master must generate the acknowledge-related clock pulse and release the SDA line (HIGH) during the acknowledge clock pulse (Figure 22). A “1” for R/W bit indicates that the read operation is to be executed. A “0” indicates that the write operation is to be executed. The second byte consists of the address for control registers of the AK4708. The format is MSB first, and those most significant 3-bits are fixed to zeros (Figure 16). The data after the second byte contain control data. The format is MSB first, 8bits (Figure 17). The AK4708 generates an acknowledge after each byte has been received. A data transfer is always terminated by a STOP condition generated by the master. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition (Figure 20).

The AK4708 can execute multiple one byte write operations in a sequence. After receipt of the third byte, the AK4708 generates an acknowledge, and awaits the next data again. The master can transmit more than one byte instead of terminating the write cycle after the first data byte is transferred. After the receipt of each data, the internal address counter is incremented by one, and the next data is taken into next address automatically. If the address exceeds 0DH prior to generating the stop condition, the address counter will “roll over” to 00H and the previous data will be overwritten. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW (Figure 22) except for the START and the STOP condition.

Figure 14. Data transfer sequence at the I²C-bus mode

Figure 15. The first byte

Figure 16. The second byte

Figure 17. Byte structure after the second byte

2. READ Operations

Set R/W bit = "1" for READ operations. After transmission of data, the master can read the next address's data by generating an acknowledge instead of terminating the write cycle after the receipt the first data word. After the receipt of each data, the internal address counter is incremented by one, and the next data is taken into next address automatically. If the address exceeds 09H prior to generating the stop condition, the address counter will "roll over" to 00H and the previous data will be overwritten.

The AK4708 supports two basic read operations: CURRENT ADDRESS READ and RANDOM READ.

2-1. CURRENT ADDRESS READ

The AK4708 contains an internal address counter that maintains the address of the last word accessed, incremented by one. Therefore, if the last access (either a read or write) was to address n, the next CURRENT READ operation would access data from the address n+1. After receipt of the slave address with R/W bit set to "1", the AK4708 generates an acknowledge, transmits 1byte data which address is set by the internal address counter and increments the internal address counter by 1. If the master does not generate an acknowledge to the data but generate the stop condition, the AK4708 discontinues transmission.

Figure 18. CURRENT ADDRESS READ

2-2. RANDOM READ

Random read operation allows the master to access any memory location at random. Prior to issuing the slave address with the R/W bit set to "1", the master must first perform a "dummy" write operation. The master issues a start condition, slave address (R/W bit = "0") and then the register address to read. After the register address is acknowledge, the master immediately reissues the start condition and the slave address with the R/W bit set to "1". Then the AK4708 generates an acknowledge, 1-byte data and increments the internal address counter by 1. If the master does not generate an acknowledge to the data but generate the stop condition, the AK4708 discontinues transmission.

VCRG: VCRGO output control

VCRB: VCRBO output control

VCRFB: VCRFBO output control

0: Hi-Z (default)

1: Active.

FBV: VCR Fast Blanking output control (for VCRFBO pin)

0: 0V (default)

0: 2V<, 4V(typ) at 150Ω load

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
0DH	Main volume	0	0	VOL2	VOL1	VOL0	1	1	1
	R/W	R/W							
	Default	0	0	0	1	1	1	1	1

VOL2-0: Volume #0 control

Those registers control both Lch and Rch of Volume #0.

- 111: Volume gain = +12dB
- 110: Volume gain = +9dB
- 101: Volume gain = +6dB
- 100: Volume gain = +3dB
- 011: Volume gain = +0dB (default)
- 010: Volume gain = -3dB
- 001: Volume gain = -6dB
- 000: MUTE

SYSTEM DESIGN

Figure 23 shows the system connection diagram example. The evaluation board AKD4708 demonstrates application circuits, the optimum layout, power supply arrangements and measurement results.

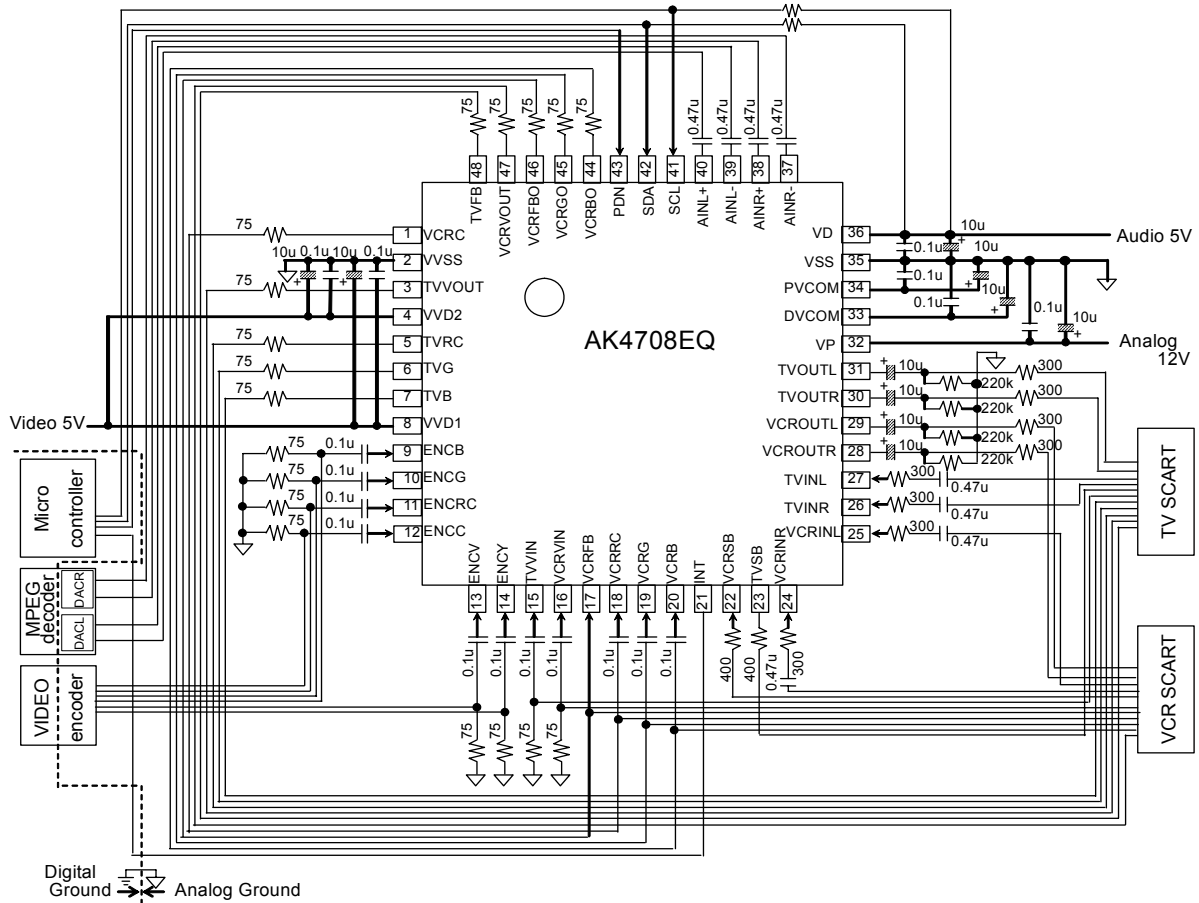

Figure 23. Typical Connection Diagram

■ Grounding and Power Supply Decoupling

VD, VP, VVD1, VVD2, VSS and VVSS should be supplied from analog supply unit with low impedance and be separated from system digital supply. An electrolytic capacitor 10 μ F parallel with a 0.1 μ F ceramic capacitor should be attached to these pins to eliminate the effects of high frequency noise. The 0.1 μ F ceramic capacitor should be placed as near to VD (VP, VVD1, VVD2) as possible.

■ Voltage Reference

Each DVCOM/PVCOM are common voltage of this chip. An electrolytic capacitor 10 μ F parallel with a 0.1 μ F ceramic capacitor should be attached to these VCOM pins to eliminate the effects of high frequency noise. No load current should be drawn from these VCOM pins. All signals, especially clocks, should be kept away from these VCOM pins in order to avoid unwanted coupling into the AK4708.

■ Analog Audio Outputs

The analog outputs are also single-ended and centered on 5.6V(typ.). The output signal range is typically 2Vrms .

■ External Circuit Example

Analog Audio Input pin

Analog Audio Input pin

Analog Audio Output pin

Analog Video Input pin

Analog Video Output pin

Slow Blanking pin

Fast Blanking Input pin

Fast Blanking Output pin

PACKAGE

48pin LQFP(Unit:mm)

■ Package & Lead frame material

- Package molding compound: Epoxy
- Lead frame material: Cu
- Lead frame surface treatment: Solder (Pb free) plate

IMPORTANT NOTICE

- These products and their specifications are subject to change without notice.
When you consider any use or application of these products, please make inquiries the sales office of Asahi Kasei EMD Corporation (AKEMD) or authorized distributors as to current status of the products.
- AKEMD assumes no liability for infringement of any patent, intellectual property, or other rights in the application or use of any information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKEMD products are neither intended nor authorized for use as critical components_{Note1} in any safety, life support, or other hazard related device or system_{Note2}, and AKEMD assumes no responsibility for such use, except for the use approved with the express written consent by Representative Director of AKEMD. As used here:
 - Note1) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.
 - Note2) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.
- It is the responsibility of the buyer or distributor of AKEMD products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKEMD harmless from any and all claims arising from the use of said product in the absence of such notification.
