## DESCRIPTION

The Accutek AK594096 high density memory module is a CMOS random access memory organized in 4 Meg x 9 bit words. The assembly consists of two 4 Meg x 4 and one 4 Meg x 1 DRAMs, mounted on the front side of a printed circuit board in 30 pad SIM (leadless) or 30 pin SIP (leadless) configuration with JEDEC-standard pinouts. Designed especially for low-height applications such as VMEbus boards, this low profile module is 0.550 inch high.

The operation is identical to nine 4 Meg x 1 DRAMs. For the lower eight bits, data input is tied to data output and brought out separately for each bit, with common  $\overline{RAS}$  and  $\overline{CAS}$  control. This common I/O feature dictates the use of early-write cycles to prevent contention of data In and data out. Since the Write-Enable ( $\overline{WE}$ ) signal must always go low before  $\overline{CAS}$  in a write cycle, Read-Write and Read-Modify-Write operation is not possible. For the ninth bit, data in ( $D_9$ ) and data out ( $Q_9$ ) pins are brought out separately and controlled by a separate  $\overline{PCAS}$  for that bit.
