Description

The AK8110A is a single clock generator IC with an integrated PLL. It can generate either a 36.0MHz or 38.0MHz clock from a 27MHz master clock input frequency. Through pin control, the output can be enabled or disabled, and the frequency can be changed. The high performance PLL locks to the master clock input, generating a low jitter, highly accurate clock output without an external crystal.

Applications

- Digital Still Camera

Pin Descriptions

Pin No.	Pin Name	Pin Type	Description
1	VDD	--	Power Supply
2	VSS	--	Ground
3	CLKOUT	OUT	Clock output Output clock frequency is selectable to 36.0MHz or 38.0MHz by setting the FSEL pin. In power down mode (OE = “L”), this pin is “L”.
4	OE	IN	CLKOUT output enable control “L”: CLKOUT=”L” and power down. “H”: active (1)
5	FSEL	IN	Clock frequency select “L”: 38.0MHz, “H”: 36.0MHz (1)
6	CLKIN	IN	Clock input (27MHz) Place the AK8110A in power down (OE = “L”) mode when an input clock is not supplied. Unstable input to the CLKIN causes the unstable CLKOUT signal. DC input to the CLKIN also causes the unstable CLKOUT signal.

Note

(1) Stress beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. F unctional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” is not implied. Exposure to absolute-maximum-rating conditions for extended periods may affect device reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

ESD Sensitive Device

This device is manufactured on a CMOS process, therefore, generically susceptible to damage by excessive static voltage. Failure to observe proper handling and installation procedures can cause damage. AKM recommends that this device is handled with appropriate precautions.
