Product Description

The ALVC16245 is designed specifically for asynchronous communication between data buses. The control-function implementation minimizes external timing requirements.

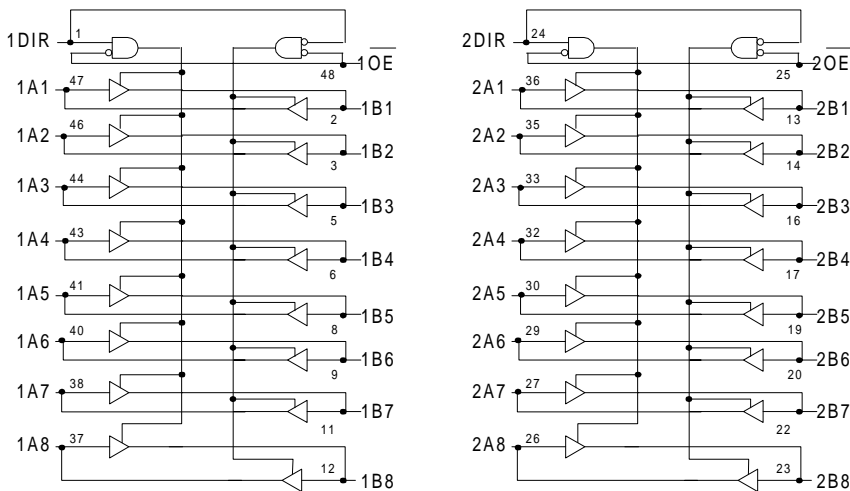

Product Description (Cont.)

The device can be used as two 8-bit transceivers, or one 16-bit transceiver. It allows data transmission for the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable (OE) input can be used to disable the device so that the buses are effectively isolated.

The outputs, which are designed to sink up to 24 mA, include controlled edge rates to reduce overshoot and undershoot.

To ensure the high-impedance state during power up or power down, OE should be tied to V_{DD} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driving device.
