

## ■ General Description

The AME7739 is a charge pump voltage converter that delivers a regulated output. No external inductor is required for operation. Using three small capacitors, the AME7739 can deliver up to 60mA to the voltage regulated output. The AME7739 features very low output ripple and high efficiency over a large portion of its load range making this device ideal for battery-powered applications. Furthermore, the combination of few external components and small package size keep the total converter board area to a minimum in space restricted applications.

The AME7739 contains a thermal management circuit to protect the device under continuous output short circuit conditions.

The AME7739 is available in SOT-26 package and is rated from -40°C to 85°C.

## ■ Features

- Output Voltage Range:  
5.5V, 5V, 3.3V, 3.0V, 2.7V, 2.5V
- Accurate to with  $\pm 5\%$
- 1MHz<sub>z</sub> Switching Frequency
- Shutdown Supply Current < 1 $\mu$ A
- Short Circuit Protection: Typ. 80mA
- Over Temperature Protection
- All AME's Lead Free Product Meet RoHS Standards

## ■ Applications

- Cellular Phone
- Digital Camera
- PDAs LCD display
- LED/Display Back Light Driver
- Smart Card Reader
- SIM Card Supply
- PCMCIA Card
- LCD Display

## ■ Functional Block Diagram

## ■ Typical Application

■ Pin Configuration

AME7739AEEY

1. OUT
2. GND
3. EN
4. C-
5. IN
6. C+

\* Die Attach:  
Conductive Epoxy

■ Pin Description

Pin Number	Pin Name	Description
1	OUT	Regulator Output Pin. $V_{OUT}$ should be bypassed with a 2.2uF low ESR ceramic capacitor.
2	GND	Ground Pin Connection.
3	EN	Enable Input. Active Low disable the regulator.
4	C-	Pump Capacitor Negative Terminal.
5	IN	Input Supply Pin. $V_{IN}$ should be bypassed with a 2.2uF low ESR ceramic capacitor.
6	C+	Pump Capacitor Positive Terminal.

Over Temperature Hysteresis	OTH			20		

Note 1: Effective series resistance (ESR) of capacitors is  $< 0.1\Omega$ .

### ■ Detailed Description

The AME7739 regulated charge pump provides a regulated input voltages ranging from less than the output to greater than the input. This is accomplished by automatic mode switching within the device.

### ■ Short Circuit and Thermal Protection

www.DataSheet4U.com

The AME7739 has a thermal protection and shutdown circuit that continuously monitors the IC junction temperature. If the thermal protection circuit senses the die temperature exceeding approximately 160°C, the thermal shutdown will disable the charge pump switching cycle operation, The thermal limit system has 20°C of system hysteresis before the charge pump can reset. Once the over current event is removed from the output and the junction temperature drops below 140°C, the charge pump will the become active again. The thermal protection system will cycle on and off if an output short circuit condition persists. This will allow the AME7739 to operate indefinitely a short circuit condition without damage to the device.

### ■ Shutdown Mode

A control pin EN on the regulator can be used to place the device into an energy-saving shutdown mode. In this mode, the output is disconnected from the input as long as  $V_{IN}$  is greater than or equal to minimum  $V_{IN}$  and input quiescent current is reduced to 1µA maximum.

### ■ Capacitor Selection

For minimum output voltage ripple, the output capacitor  $C_{OUT}$  should be a ceramic, surface-mount type. Tantalum capacitors generally have a higher Effective Series Resistance (ESR) and may contribute to higher output voltage ripple. Leaded capacitors also increase ripple due to the higher inductance of the package itself. To achieve best operation with low input voltage and high load current, the input and pump capacitors ( $C_{IN}$ ,  $C_{PUMP}$  respectively) should also be surface-mount ceramic types. In all cases, X7R dielectric is recommended.

With light loads or higher input voltage, a smaller 0.1µF pump capacitor ( $C_{PUMP}$ ) and smaller 1µF input and output capacitor ( $C_{IN}$  and  $C_{OUT}$ , respectively) can be used. To minimize output voltage ripple, increase the output capacitor,  $C_{OUT}$ , to 10µF or larger.

### ■ Efficiency

The efficiency of the charge pump regulator varies with the output voltage version, the applied input voltage, the load current, and the internal operation mode of the device.

The approximate efficiency is given by:

$$\text{Efficiency (\%)} = \frac{V_{OUT}}{2V_{IN}} \cdot 100\% \quad (V_{IN} \leq V_{OUT})$$

$$\text{Efficiency (\%)} = \frac{V_{OUT}}{V_{IN}} \cdot 100\% \quad (V_{IN} > V_{OUT})$$

### ■ Layout

Large ripple currents flow in the  $V_{IN}$  and  $V_{OUT}$  traces. To minimized both input and output ripple, keep the capacitors as close as possible to the regulator using short, direct circuit traces.

The trace lengths from the input and output capacitors have been kept as short as possible. A star ground system has been implemented, with GND pin as the center of the star. No ground plane is provided in other layers, as this will provide capacitive coupling for noise spikes.
