

HIGH VOLTAGE GREEN MODE PWM CONTROLLER**AP3106****General Description**

The AP3106 is a high voltage start-up, current mode PWM controller with green-mode power-saving operation.

The PWM switching frequency at normal operation is externally programmable and trimmed to a narrow range.

The AP3106 integrates a proprietary internal frequency dithering function that helps to reduce EMI emission of a power supply with minimum line filters used.

To minimize the standby power consumption, a proprietary adaptive green-mode function is available to implement frequency modulation under light-load conditions. To avoid acoustic noise problems, the minimum PWM frequency is set at about 26kHz.

The AP3106 integrates a lot of functions such as the Lead-Edge Blanking (LEB) of the current sensing, internal slope compensation, line compensation, and several protection features that include cycle-by-cycle current limit (OCP), over voltage protection, OTP, OLP and brownout protection.

The AP3106 is available in SOIC-7 package to realize a compact size.

Pin Description

Pin Number	Pin Name	Function
1	RI	Set the bias current to determine the normal switching frequency
2	FB	Voltage feedback pin. By connecting an opto-coupler to close the control loop, it can achieve the system regulation
3	SENSE	Current sense pin. Connect it to sense the MOSFET current
4	GND	Ground
5	GATE	Gate drive output to drive the external MOSFET
6	VCC	Supply voltage pin
7	HV	Connect this pin to positive terminal of bulk capacitor to provide the startup current for the controller. When VCC voltage reaches UVLO (on), this HV loop will be turned off to save the power loss of the startup circuit
