

❖ GENERAL DESCRIPTION

The APE1901 is high efficient step-up DC/DC converter. Large output current is possible having a built in internal N channel MOSFET, and using an external coil and diode.

The APE1901 can be operated at switching frequencies of 500kHz allowing for easy filtering and low noise, the size of the external components can be reduced.

Output voltage is programmable with 1.0V of standard voltage supply internal, and using externally connected components, output voltage (FB) can be set up at will.

This converter also contains an error amplifier circuit as well as a soft-start circuit that prevents inrush-current at startup. An enable function and thermal shutdown functions are built inside.

❖ FEATURES

- Input voltage: 3V to 15V
- Output voltage: 3.3V to 28V($\pm 2.5\%$)
- Duty ratio: 0% to 80% PWM control
- Switch current: 3A(MAX)
- Oscillation frequency: 500KHz.
- Enable function
- Soft-start function
- Thermal Shutdown function
- Built-in internal SW N-channel MOS
- SOP-8L Pb-Free Package.

❖ PIN ASSIGNMENT

The package of AX5101A is SOP-8L; the pin assignment is given by:

Name	Description
SGND	Signal ground pin.
EN	Power-off pin H : normal operation(Step-up) L : Step-up operation stopped (All circuits deactivated)
Vcc	IC power supply pin
FB	Feedback pin
SW	Switch pin. Connect external inductor & diode here.
Vss	GND pin

❖ Function Descriptions

PWM Control

The APE1901 consists of DC/DC converters that employ a pulse-width modulation (PWM) system.

In converters of the APE1901, the pulse width varies in a range from 0 to 80%, according to the load current. The ripple voltage produced by the switching can easily be removed through a filter because the switching frequency remains constant. Therefore, these converters provide a low-ripple power over broad ranges of input voltage and load current.

Setting the Output Voltage

Application circuit item shows the basic application circuit with APE1901 adjustable output version. The external resistor sets the output voltage according to the following equation:

$$V_{OUT} = 1.0V \times \left(1 + \frac{R1}{R2}\right)$$

Output Voltage Ripple

Application circuit item shows the basic application circuit with APE1901. The output voltage ripple (V_{RIPPLE}) very larger at high switch current ($I_{SW}=3A$, $V_{RIPPLE} \doteq 0.7V$), external π filters can reduce output voltage ripple or add MLCC 22uF at output(see next page for output ripple wave):

b. C6=22uF(MLCC)

PCB layout guide

If you need low T_c & T_j or large PD(Power Dissipation), The dual SW pins(5&6) at the SOP-8L package are internally connected to die pad, The PCB layout should allow for maximum possible copper area at the V_{CC} pins of the APE1901.
