

High-Current Overvoltage Protectors with Adjustable OVLO

Features

- Wide supply voltage range from 3.8V to 28V
- Low ON resistance: 50mΩ(Max) at a supply voltage of 5V
- Flexible overvoltage-protection trip level
 - Wide adjustable OVLO threshold range from 4V to 20V
 - Preset internal accurate OVLO threshold
- Low quiescent current 70μA
- Internal 8ms startup debounce
- Protection circuitry:
 - Surge Immunity to 100V
 - Overvoltage lockout
- Low Capacitance ESD Protection
- Available in WLCSP1.82x1.22-12 Packages
- Lead Free Green Devices Available (RoHS Compliant)

General Description

The APL3227E overvoltage protection devices feature a low 50mΩ (max) RON internal FET and protect low-voltage systems against voltage faults up to +28VDC. An internal clamp also protects the devices from surge up to +120V. When the input voltage exceeds the overvoltage threshold, the internal FET is turned off to prevent damage to the protected downstream components.

The overvoltage protection threshold can be adjusted with optional external resistors to any voltage between 4V and 20V. With the OVLO input set below the external OVLO select voltage, the APL3227E automatically choose the accurate internal trip thresholds. The internal overvoltage thresholds (OVLO) are preset to 13.32V typical. The devices feature an open-drain $\overline{\text{ACOK}}$ output indicating a stable supply between minimum supply voltage and VOVLO. The APL3227E are also protected against over current events by an internal thermal shutdown.

Applications

- Smart Phones and PDAs
- Digital Still Cameras
- Portable Devices

Ordering and Marking Information

APL3227E — Assembly Material Handling Code Temperature Range Package Code	Package Code HA : WLCSP1.82x1.22-12 Operating Ambient Temperature Range I : - 40 to 85 C Handling Code TR : Tape & Reel Assembly Material G : Halogen and Lead Free Device
APL3227E HA: • 27X	X - Date Code

Note : ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines “Green” to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{IN}	IN to GND Voltage	-0.3 ~ 30	V
V_{OUT}	OUT to GND Voltage	-0.3 ~ 30	V
V_{OVLO}	OVLO to GND Voltage	-0.3 ~ 24	V
V_{AOCK}	AOCK to GND Voltage	-0.3 ~ 7	V
V_{EN}	EN to GND Voltage	-0.3 ~ 7	V
T_J	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature	-65 ~ 150	°C
T_{SDR}	Maximum Lead Soldering Temperature (10 Seconds)	260	°C

Note1: Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ_{JA}	Junction-to-Ambient Thermal Resistance in free air ^(Note 2) WLCSP1.82x1.22-12	89	°C/W

Note 2 : θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions (Note3)

Symbol	Parameter	Range	Unit
V_{IN}	IN Input Voltage	3.8 ~ 28	V
I_{OUT}	Output Current	0 ~ 3.5	A

Pin Description

PIN		Function
WLCSP1.82x1.22	NAME	
A1	$\overline{\text{EN}}$	Enable Pin. The device enters in shutdown mode when this pin is tied to a high level. In this case the output is disconnected from the input. To allow normal functionality, the $\overline{\text{EN}}$ pin shall be connected to GND to a pull down or to a I/O pin. This pin does not have an impact on the fault detection.
B1	$\overline{\text{ACOK}}$	Open-Drain Flag Output. $\overline{\text{ACOK}}$ is driven low after input voltage is stable between minimum VIN and VOVLO after debounce. Connect a pullup resistor from $\overline{\text{ACOK}}$ to the logic I/O voltage of the host system. $\overline{\text{ACOK}}$ is high impedance after thermal shutdown.
C1	OVLO	External OVLO Adjustment. Connect OVLO to GND when using the internal threshold. Connect a resistor-divider to OVLO to set a different OVLO threshold; this external resistor-divider is completely independent of the internal threshold.
A2,A3,B2	OUT	Output Voltage. Output of internal switch. Connect OUT pins together for proper operation.
B3,C2,C3	IN	Voltage Input. Connect IN with a 1uF ceramic capacitor as close as possible to the device. Connect IN pins together for proper operation.
A4,B4,C4	GND	Ground. Connect GND pins together for proper operation

Block Diagram

Typical Application Circuit

Function Description

Detailed Description

The APL3227E overvoltage protection devices feature a low on-resistance (R_{ON}) internal FET and protect low-voltage systems against voltage faults up to +28VDC. An internal clamp also protects the devices from surges up to +120V. If the input voltage exceeds the overvoltage threshold, the internal FET is turned off to prevent damage to the protected components. The 8ms debounce time built into the device prevents false turn on of the internal FET during startup.

Device Operation

The devices contain timing logic that controls the turn-on of the internal FET. The internal charge pump is enabled when $V_{IN} < V_{IN_OVLO}$ if internal trip thresholds are used and when $V_{OVLO} < V_{OVLO_TH}$ if external trip thresholds are used. The charge-pump startup, which occurs after a 8ms debounce delay, turns the internal FET on.

Internal Switch

The APL3227E incorporate an internal FET with a 30m Ω (typ) R_{ON} . The FET is internally driven by a charge pump that generates a necessary gate voltage above V_{IN} .

Overvoltage Lockout (OVLO)

When the V_{IN} voltage rises above V_{OVLO} , the internal FET switch is turned OFF. When the V_{IN} voltage returns below V_{OVLO} , the FET switch is turned on again after the internal delay of. This delay time ensures that the V_{IN} supply has stabilized before turning the switch back on. When the OVP condition is cleared and the FET is completely turned ON.

Thermal-Shutdown Protection

The APL3227E feature thermal shutdown circuitry. The internal FET turns off when the junction temperature exceeds +130°C (typ). The device exits thermal shutdown after the junction temperature cools by 30°C (typ).

ACOK Output

An open-drain $\overline{ACOK}$ output gives the APL3227E the ability to communicate a stable power source to the host system. $\overline{ACOK}$ is driven low after input voltage is stable between minimum V_{IN} and V_{OVLO} after debounce. Connect a pullup resistor from $\overline{ACOK}$ to the logic I/O voltage of the host system. $\overline{ACOK}$ is high impedance after thermal shutdown.

OCP

The output current is monitored by the internal OCP circuit. When the output current reaches the OCP threshold, the device limits the output current at OCP threshold level. If the OCP condition continues for a debounce time, the internal power FET is turned off. After the recovery time, the FET will be turned on again and the output current is monitored again.

Under normal application, when the current reach the current limit level with debounce time 80us, the internal switch turn off. The release condition is after 40ms & $T_J < 90^\circ\text{C}$.

Application Information

IN Bypass Capacitor

For most applications, bypass IN to GND with a 1μF ceramic capacitor as close as possible to the device. If the power source has significant inductance due to long lead length, the device clamps the overshoot due to LC tank circuit.

External OVLO Adjustment Functionality

If OVLO is connected to ground, the internal OVLO comparator uses the internally set OVLO value.

If an external resistor-divider is connected to OVLO and V_{OVLO} exceeds the OVLO select voltage, V_{OVLO_SELECT} , the internal OVLO comparator reads the IN fraction fixed by the external resistor divider. $R1 = 1M\Omega$ is a good starting value for minimum current consumption. Since V_{IN_OVLO} , V_{OVLO_THRESH} , and $R1$ are known, $R2$ can be calculated from the following formula:

$$V_{IN_OVLO} = V_{OVLO_TH} \times \left(1 + \frac{R1}{R2}\right)$$

This external resistor-divider is completely independent from the internal resistor-divider.
