

AS1340

50V, Micropower, DC-DC Boost Converter

Data Sheet

1 General Description

The AS1340 boost converter contains a 1.4A internal switch in a tiny TDFN-8 3x3mm package. The device operates from a 2.7 to 5.5V supply, and can boost voltages up to 50V output.

The output voltage can easily be adjusted by an external resistor divider.

The AS1340 uses a unique control scheme providing the highest efficiency over a wide range of load conditions. An internal 1.4A MOSFET reduces external component count, and a fixed high switching frequency (1MHz) allows for tiny surface-mount components.

The AS1340 also features power-OK circuitry which monitors the output voltage.

Additionally the AS1340 features a low quiescent supply current and a shutdown mode to save power. During shutdown an output disconnect switch separates the input from the output.

The AS1340 is ideal for LCD or OLED panels with low current requirements and can also be used in a wide range of other applications.

The device is available in a low-profile TDFN-8 3x3mm package.

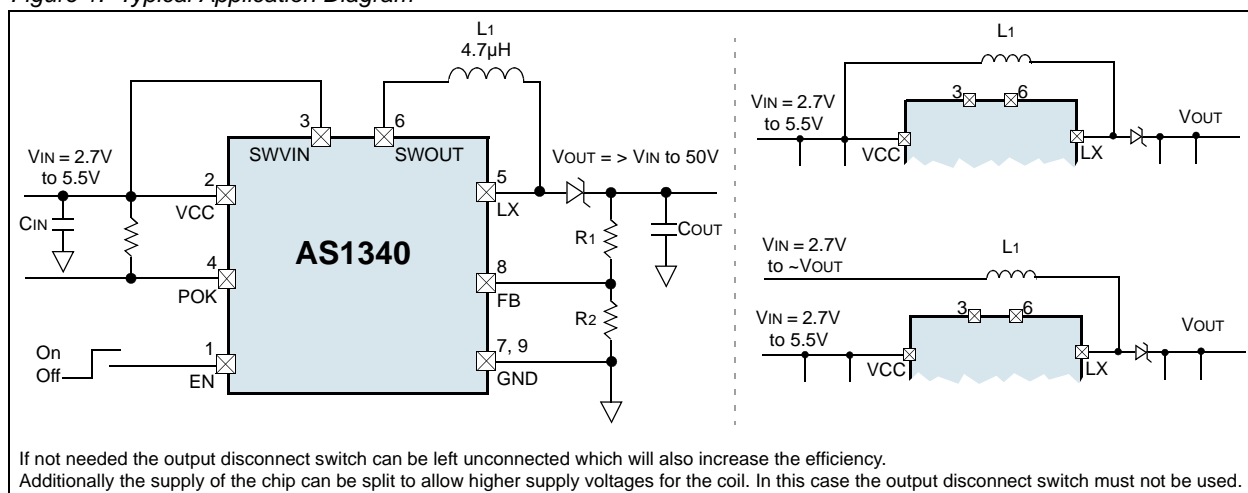

2 Key Features

- 2.7V to 50V Adjustable Output Voltage
- 2.7V to 50V Input Voltage Range
- 2.7V to 5.5V Supply Voltage Range
- High Output Currents:
 - 100mA @ 12V from 3.3V V_{IN}
 - 50mA @ 24V from 3.3V V_{IN}
 - 30mA @ 36V from 3.3V V_{IN}
- Efficiency: Up to 93%
- Switching Frequency: 1MHz
- Output Disconnect
- Power-OK Output
- Operating Supply Current: 30 μ A
- Shutdown Current: 0.1 μ A
- TDFN-8 3x3mm Package

3 Applications

The device is ideal for OLED display power supply, LED power supply, LCD bias generators, mobile/cordless phones, palmtop computers, PDAs and organizers, handy terminals or any other portable, battery-powered device.

Pin Assignments

Figure 2. Pin Assignments (Top View)

Pin Descriptions

Table 1. Pin Descriptions

Pin Number	Pin Name	Description
1	EN	Active-High Enable Input. A logic low on this pin shuts down the device and reduces the supply current to 0.1µA. Note: Connect to VCC for normal operation.
2	VCC	+2.7V to +5.5V Supply Voltage. Bypass this pin to GND with a $\geq 1\mu\text{F}$ capacitor.
3	SWVIN	Shutdown Disconnect Switch In
4	POK	Power-OK. 0 = $V_{\text{OUT}} < 90\%$ of V_{OUTNOM} . 1 = $V_{\text{OUT}} > 90\%$ of V_{OUTNOM} .
5	LX	Inductor. The drain of the internal N-channel MOSFET. Note: This pin is high impedance in shutdown.
6	SWOUT	Shutdown Disconnect Switch Out. Disconnects the input from the output during shutdown.
7	GND	Ground
8	FB	Feedback Pin. Feedback input to the g_m error amplifier. Connect a resistor divider tap to this pin. The output voltage can be adjusted from V_{IN} to 50V by: $V_{\text{OUT}} = 1.25V[1 + (R_1/R_2)]$
9	GND	Ground

5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 2](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics on page 4](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Min	Max	Units	Comments
VCC, FB, EN to GND		7	V	
SWVIN, SWOUT to GND		7		
LX to GND		55		
Thermal Resistance Θ_{JA}	36.7		°C/W	on PCB
ESD	1.5		kV	<i>HBM MIL-Std. 883E 3015.7 methods</i>
Latch-Up	-100	+100	mA	<i>JEDEC 78</i>
Operating Temperature Range	-40	+85	°C	
Storage Temperature Range	-65	+150	°C	
Junction Temperature		125	°C	
Package Body Temperature		+260	°C	The reflow peak soldering temperature (body temperature) specified is in accordance with <i>IPC/JEDEC J-STD-020C "Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices"</i> . The lead finish for Pb-free leaded packages is matte tin (100% Sn).

6 Electrical Characteristics

$V_{CC} = EN = 2.7V$, $T_{AMB} = -40$ to $+85^{\circ}C$ (unless otherwise specified). Typ values are at $T_{AMB} = +25^{\circ}C$.

Table 3. Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V _{CC}	Supply Voltage		2.7		5.5	V
V _{IN}	Inductor Input Voltage Range		2.7		50	V
V _{OUT}	Output Voltage Range		2.7		50	V

8 Detailed Description

The AS1340 features a current limiting circuitry, a fixed-frequency PWM architecture, power-OK circuitry, thermal protection, and an automatic powersave mode in a tiny package, and maintains high efficiency at light loads.

Figure 27. Block Diagram with Shutdown Disconnect Switch

Automatic powersave mode regulates the output and also reduces average current flow into the device, resulting in high efficiency at light loads. When the output increases sufficiently, the powersave comparator output remains high, resulting in continuous operation.

For each oscillator cycle, the power switch is enabled. A voltage proportional to switch current is added to a stabilizing ramp and the resulting sum is delivered to the positive terminal of the PWM comparator.

The error amplifier compares the voltage at FB with the internal 1.25V reference and generates an error signal (V_c). When V_c is below the powersave mode threshold voltage the automatic powersave-mode is activated and the hysteretic comparator disables the power circuitry, with only the low-power circuitry still active (total current consumption is minimized).

When a load is applied, V_{FB} decreases; V_c increases and enables the power circuitry and the device starts switching. In light loads, the output voltage (and the voltage at FB) will increase until the powersave comparator disables the power circuitry, causing the output voltage to decrease again. This cycle is repeated resulting in low-frequency ripple at the output.

The POK output indicates whether the output voltage is within 90% of the nominal output voltage level or not. When EN is low, the circuit is not active and POK gives a high signal when connected to VCC by a pull-up resistor. When EN goes high, POK goes low after appr. 50µs and will go high when the output reaches 90% of the nominal output voltage (see Figure 20 on page 7). When input and output voltage are almost the same, it may happen that the POK Signal does not go low because V_{OUT} reaches 90% before the delay has expired. The open-drain POK output sinks current, when EN is high and the output voltage is below 90% of the nominal output voltage.

Thermal protection circuitry shuts down the device when its temperature reaches 145°C.

9 Application Information

Power Supply Concept

The AS1340 has an operating voltage range from 2.7 to 5.5V. If the inductor is supplied from the same source the battery disconnect switch can be used as well (see Figure 1 on page 1). In case that a input voltage source is higher than 5.5V, the inductor can be supplied separately up to 50V (see Figure 28), but then the battery disconnect switch cannot be used, because its operating voltage range is limited to 5.5V.

Shutdown

A logic low on pin EN shuts down the AS1340 and a logic high on EN powers on the device.

In shutdown mode the supply current drops to below 1µA to maximize battery life. In case that the battery disconnect switch is used, the battery is disconnected from the output during shutdown.

Note: Pin EN should not be left floating. If the shutdown feature is not used, connect EN to V_{IN}.

Battery Disconnect

The AS1340 has an integrated switch that can be used to disconnect the battery during shutdown. The operation voltage of this switch is limited to 5.5V. When EN is high, the switch is closed and supplies the inductor. Due to the R_{ON} resistance the efficiency is slightly lower if the battery disconnect switch is used.

$$P_{LOSS} = I_{IN}^2 \times R_{ON} \quad (EQ 1)$$

Setting Output Voltage

Output voltage can be adjusted by connecting a voltage divider between pins LX and FB (see Figure 28).

Figure 28. Typical Application (SWVIN and SWOUT not in use.)

The output voltage can be adjusted by selecting different values for R₁ and R₂. For R₂, select a value between 10k and 200kΩ.

Calculate R₁ by:

$$R_1 = R_2 \cdot \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) \quad (EQ 2)$$

Where:

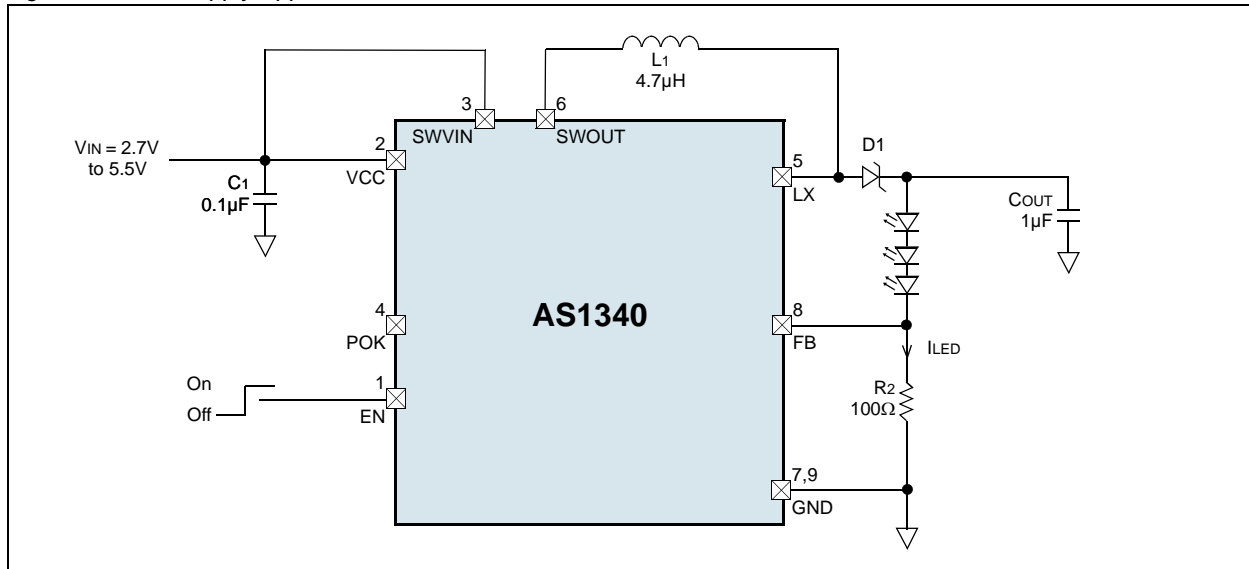

V_{OUT} = V_{IN} to 50V, V_{FB} = 1.25V

The input bias current of FB has a maximum value of 100nA which allows for large-value resistors. For less than 1% error, the current through R₂ should be 100 times the feedback input bias current (I_{FB}).

LED Power Supply Application

The AS1340 can also be used for driving LEDs. Just simply connect the LEDs between the pins LX and FB. (see Figure 29).

Figure 29. LED Supply Application

The output voltage is adjusted automatically to the required voltage of the LEDs. This voltage depends on the forward voltage (V_F) of the used LEDs and the Feedback Voltage V_{FB} .

Calculate V_{OUT} by:

$$V_{OUT} = V_F(I_{LED}) \times n + V_{FB} \quad (EQ 3)$$

Note: The brightness of the LEDs can directly be adjusted by setting the current I_{LED} via the corresponding R_2 .

Calculate R_2 by:

$$I_{LED} = \frac{V_{FB}}{R_2} \quad (EQ 4)$$

Where:

$V_{FB} = 1.25V$

n number of LED's

Inductor Selection

For the external inductor, a 6.8 μ H inductor is recommended. Minimum inductor size is dependant on the desired efficiency and output current. Inductors with low core losses and small DCR at 1MHz are recommended.

Table 4. Recommended Inductors

Part Number	L	DCR	Current Rating	Dimensions (L/W/T)	Manufacturer
LPS4018-472ML_	4.7 μ H	0.125 Ω	1.9A	4.4x4.4x1.7mm	Coilcraft www.coilcraft.com
ME3220-472ML_	4.7 μ H	0.190 Ω	1.5A	3.2x2.8x2mm	
MOS6020-472ML_	4.7 μ H	0.050 Ω	1.94A	6.8x6x2.4mm	
MSS6122-472ML_	4.7 μ H	0.065 Ω	1.82A	6.1x6.1x6mm	
LPS4018-682ML_	6.8 μ H	0.150 Ω	1.3A	4.4x4.4x1.7mm	
ME3220-682ML_	6.8 μ H	0.270 Ω	1.2A	3.2x2.8x2mm	
MOS6020-682ML_	6.8 μ H	0.078 Ω	1.72A	6.8x6x2.4mm	
MSS6122-682ML_	6.8 μ H	0.100 Ω	1.50A	6.1x6.1x6mm	

Figure 30. Efficiency Comparison of Different Inductors, $V_{IN} = 3.3V$, $V_{OUT} = 18V$;

Figure 31. Efficiency Comparison of Different Inductors, $V_{IN} = 5.5V$, $V_{OUT} = 18V$;

Capacitor Selection

A 4.7 μ F capacitor is recommended for C_{IN} as well as a 2 μ F for C_{OUT}. Small-sized ceramic capacitors are recommended. X5R and X7R ceramic capacitors are recommended as they retain capacitance over wide ranges of voltages and temperatures.

Output Capacitor Selection

Low ESR capacitors should be used to minimize V_{OUT} ripple. Multi-layer ceramic capacitors are recommended since they have extremely low ESR and are available in small footprints. A 2.2 to 10 μ F output capacitor is sufficient for most applications. Larger values up to 22 μ F may be used to obtain extremely low output voltage ripple and improve transient response.

X5R and X7R dielectric materials are recommended due to their ability to maintain capacitance over wide voltage and temperature ranges.

Table 5. Recommended Output Capacitor

Part Number	C	TC Code	Rated Voltage	Dimensions (L/W/T)	Manufacturer
GRM31MR71H105KA88	1 μ F	X7R	50V	C1206	Murata www.murata.com
GRM32ER71H475KA88	4.7 μ F	X7R	50V	C1210	
C1206C105K5RAC	1 μ F	X7R	50V	C1206	Kemet www.kemet.com
C1206C225K5RAC	2.2 μ F	X7R	50V	C1210	
1206C105KAT2A	1 μ F	X7R	50V	C1206	AVX www.avx.com

Input Capacitor Selection

Low ESR input capacitors reduce input switching noise and reduce the peak current drawn from the battery. Ceramic capacitors are recommended for input decoupling and should be located as close to the device as is practical. A 4.7 μ F input capacitor is sufficient for most applications. Larger values may be used without limitations.

Table 6. Recommended Input Capacitor

Part Number	C	TC Code	Rated Voltage	Dimensions (L/W/T)	Manufacturer
GRM21BR71C105KA01	1 μ F	X7R	16V	C0805	Murata www.murata.com
GRM21BR61C225KA88	2.2 μ F	X7R	16V	C0805	
GRM32DR71C106KA01	10 μ F	X7R	16V	C1210	

Diode Selection

A Schottky diode must be used to carry the output current for the time it takes the PMOS synchronous rectifier to switch on.

Note: Do not use ordinary rectifier diodes, since the slow recovery times will compromise efficiency.

Table 7. Recommended Diodes

Part Number	Reverse Voltage	Forward Current	Package	Manufacturer
PMEG4010BEA	40V	1A	SOD123	Philips www.nxp.com
MBR0540	40V	500mA	SOD123	MCC www.mccsemi.com
MBR0560	60V	500mA	SOD123	

Thermal Protection

To protect the device from short circuit or excessive power dissipation of the auxiliary NPNs, the integrated thermal protection switches off the device when the junction temperature (T_J) reaches 145°C (typ). When T_J decreases to approximately 125°C, the device will resume normal operation. If the thermal overload condition is not corrected, the device will switch on and off while maintaining T_J within the range between 125 and 145°C.

10 Package Drawings and Markings

The devices are available in a TDFN-8 3x3mm package.

Figure 32. TDFN-8 3x3mm Package

Symbol	Min	Typ	Max	Notes
A	0.70	0.75	0.80	1, 2

Notes:

1. Dimensioning and tolerancing conform to ASME Y14.5 M-1994.
2. All dimensions are in millimeters; angles in degrees.
3. N is the total number of terminals.
4. The terminal #1 identifier and terminal numbering convention shall conform to JEDEC 95-1, SPP-012. Details of terminal #1 identifier are optional, but must be located within the zone indicated. The terminal #1 identifier may be either a mold or marked feature.
5. Dimension b applies to metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
6. ND refers to the maximum number of terminals on side D.
7. Figure 32 is shown for illustration only.
8. Unilateral coplanarity zone applies to the exposed heat sink slug as well as the terminals

11 Ordering Information

The device is available as the standard products shown in [Table 8](#).

Table 8. Ordering Information
