

**512K x 8 SRAM**  
3.3 VOLT HIGH SPEED SRAM with  
CENTER POWER PINOUT

**AVAILABLE AS MILITARY  
SPECIFICATIONS**

- MIL-STD-883 for Ceramic
- Extended Temperature Plastic (COTS)

**FEATURES**

- Ultra High Speed Asynchronous Operation
- Fully Static, No Clocks
- Multiple center power and ground pins for improved noise immunity
- Easy memory expansion with CE\ and OE\ options
- All inputs and outputs are TTL-compatible
- Single +3.3V Power Supply +/- 0.3V
- Data Retention Functionality Testing
- Cost Efficient Plastic Packaging
- Extended Testing Over -55°C to +125°C for plastics
- RoHS Compliant Options Available

**OPTIONS**

- Timing
  - 10ns access
  - 12ns access
  - 15ns access
  - 20ns access
  - 25ns access
- Operating Temperature Ranges
  - 883C (-55°C to +125°C)
  - Military (-55°C to +125°C)
  - Industrial (-40°C to +85°C)

### GENERAL DESCRIPTION

The AS5LC512K8 is a 3.3V high speed SRAM. It offers flexibility in high-speed memory applications, with chip enable (CE $\setminus$ ) and output enable (OE $\setminus$ ) capabilities. These features can place the outputs in High-Z for additional flexibility in system design.

Writing to these devices is accomplished when write enable (WE $\setminus$ ) and CE $\setminus$  inputs are both LOW. Reading is accomplished when WE $\setminus$  remains HIGH and CE $\setminus$  and OE $\setminus$  go LOW.

As an option, the device can be supplied offering a reduced power standby mode, allowing system designers to meet low standby power requirements. This device operates from a single +3.3V power supply and all inputs and outputs are fully TTL-compatible.

The AS5LC512K8DJ offers the convenience and reliability of the AS5LC512K8 SRAM and has the cost advantage of a plastic encapsulation. TSOPII with copper lead frames offers superior thermal performance.

**ABSOLUTE MAXIMUM RATINGS\***

Voltage on Vcc Supply Relative to Vss  
Vcc .....-5V to 4.0V  
Storage Temperature .....-65°C to +150°C  
Short Circuit Output Current (per I/O).....20mA  
Voltage on any Pin Relative to Vss.....-5V to 4.6V  
Maximum Junction Temperature\*\*.....+150°C  
Power Dissipation .....1W

\*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.  
\*\* Junction temperature depends upon package type, cycle time, loading, ambient temperature and airflow, and humidity.

**NOTES**

- All voltages referenced to V<sub>ss</sub> (GND).
- I<sub>CC</sub> limit shown is for absolute worst case switching of ADDR, ADDR\, ADDR, etc.
- I<sub>CC</sub> is dependent on output loading and cycle rates.
- This parameter is guaranteed but not tested.
- Test conditions as specified with the output loading as shown in Fig. 1 unless otherwise noted.
- 'LZCE, 'LZWE, 'LZOE, 'HZCE, 'HZOE and 'HZWE are specified with CL = 5pF as in Fig. 2. Transition is measured ±200mV from steady state voltage.
- At any given temperature and voltage condition, 'HZCE is less than 'LZCE, and 'HZWE is less than 'LZWE.
- WE\ is HIGH for READ cycle.
- Device is continuously selected. Chip enables and output enables are held in their active state.
- Address valid prior to, or coincident with, latest occurring chip enable.
- 'RC = Read Cycle Time.
- Chip enable and write enable can initiate and terminate a WRITE cycle.
- Output enable (OE) is inactive (HIGH).
- Output enable (OE) is active (LOW).
- ASI does not warrant functionality nor reliability of any product in which the junction temperature exceeds 150°C. Care should be taken to limit power to acceptable levels.
