

ASM1816

Low Power, 3.3 V/3.0 V, μ P Reset, Active LOW, Open-Drain Output

Description

The ASM1816 is a voltage supervisory device with low-power, 3.3 V/3.0 V μ P Reset, active LOW, open-drain output. Maximum supply current over temperature is a low 15 μ A (at 3.6 V).

The ASM1816 generates an active LOW reset signal whenever the monitored supply is out of tolerance. A precision reference and comparator circuit monitor power supply (V_{CC}) level. Tolerance level options are 5%, 10%, 15% and 20%. When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces an active LOW reset signal. After V_{CC} returns to an in-tolerance condition, the reset signal remains active for 150 ms to allow the power supply and system microprocessor to stabilize.

The ASM1816 is designed with a open-drain output stage and operates over the extended industrial temperature range. Devices are available in TO-92 and compact surface mount SOT-23 packages.

Other low power products in this family include the ASM1810/11/12/15/17, ASM1233D and ASM1233M.

Features

- Low Supply Current
 - 20 μ A Maximum (5.5 V)
 - 15 μ A Maximum (3.6 V)
- Automatically Restarts a Microprocessor after Power Failure
- 150 ms Reset Delay after V_{CC} Returns to an In-tolerance Condition
- Active LOW Power-up Reset
- Precision Temperature-compensated Voltage Reference and Comparator
- Eliminates External Components
- TO-92 and Compact Surface Mount SOT-23 Package
- Operating Temperature -40°C to $+85^{\circ}\text{C}$

Applications

- Set-top Boxes
- Cellular Phones
- PDAs
- Energy Management Systems
- Embedded Control Systems
- Printers
- Single Board Computers

Application Information

Operation – Power Monitor

The ASM1816 detects out-of-tolerance power supply conditions. It resets a processor during power-up, power down and issues a reset to the system processor when the monitored power supply voltage is below the reset threshold. When an out-of-tolerance V_{CC} voltage is

detected, the $\overline{\text{RESET}}$ signal is asserted. On power-up, $\overline{\text{RESET}}$ is kept active (LOW) for approximately 150 ms after the power supply voltage has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before $\overline{\text{RESET}}$ is released.
