

ASM1834, ASM1834A, ASM1834D

Dual 5 V and 3.3 V μ P Power Supply Supervisor with Manual Reset

Description

The ASM1834 supervisors simultaneously monitor both 3.3 V and 5 V power sources and generate reset signals when either supply is out of tolerance. When an out-of-tolerance condition is detected, the output-reset signal of the affected supply becomes active and resets the system microprocessor/microcontroller. On power-up and after the supply voltage returns to an in-tolerance condition, the reset signal remains active for approximately 350 ms. This allows the power supply and system microprocessor to stabilize.

Tolerance levels are independently selectable for both supplies. Tolerance options are 5% and 10% for the 5 V supply and 10% and 20% for the 3.3 V supply.

The ASM1834 and ASM1834D have push-pull reset output stages. The ASM1834A reset outputs are open drain devices that can both be connected to either 5 V or 3.3 V supply. The ASM1834 and ASM1834A have active LOW reset outputs. The ASM1834D has active HIGH reset outputs.

All devices can generate reset signals through an internally debounced pushbutton reset input that affects both reset outputs.

All devices operate over the extended industrial temperature range. Devices are available in 8-pin DIP, surface mount 8-pin SO and 8-Pin MicroSO packages. Die are also available.

Features

- Monitors 5 V and 3.3 V Supplies Simultaneously
- 5 V and 3.3 V Power-on Reset
- 350 ms Reset Time
- Debounced Pushbutton Reset Input
- Push-pull CMOS Output
 - ASM1834, ASM1834D
 - Eliminates External Pull-up Resistors
 - Active LOW (ASM1834), HIGH (ASM1834D)
- Open Drain Output
 - ASM1834A
 - Active LOW
- Selectable 5 V and 3.3 V Trip Point Tolerance
- Internal Power Drawn from Highest Input Voltage, 5 V or 3.3 V
- Precision Temperature-compensated Voltage Reference and Comparator
- Low Cost Surface Mount SO, Compact MicroSO and DIP Packages
- Wide Operating Temperature: -40°C to $+85^{\circ}\text{C}$

Applications

- Microprocessors
- PDAs, Hand-held PCs
- Embedded Controllers
- Telecommunication Systems
- Power Supplies
- Wireless / Cellular Systems
- Networking Hardware

Table 1. PIN DESCRIPTION

Pin #	Pin Name	Function
1	5V _{IN}	5 V power supply input.
2	5V RESET 5V RESET	5 V reset output (Active LOW, ASM1834, ASM1834A. Open drain outputs for ASM1834A). 5 V reset output (Active HIGH, ASM1834D).
3	5V TOL	5 V input tolerance select: 10% tolerance for 5VTOL = 5 V _{IN} and 5% tolerance for 5VTOL = GND
4	GND	Ground.
5	PBRST	Debounced manual pushbutton reset input (40 kΩ internal pull-up).
6	3.3V TOL	3.3 V input tolerance select: 20% tolerance for 3.3VTOL = 3.3 V _{IN} and 10% tolerance for 3.3VTOL = GND.
7	3.3V RESET 3.3V RESET	3.3 V reset output (Active LOW, ASM1834, ASM1834A. Open drain outputs for ASM1834A). 3.3 V reset output (Active HIGH, ASM1834D).
8	3.3V _{IN}	3.3 V power supply input.

Table 2. ABSOLUTE MAXIMUM RATINGS

Parameter		Min	Max	Unit
Voltage on V _{CC} (Note 1)		-0.5	7	V
Voltage on 5V RESET (Note 1)		-0.5	+5V _{IN} + 0.5 V	V
Voltage on 3.3V RESET (Note 1)		-0.5	+3.3V _{IN} + 0.5 V	V
Voltage on PBRST and reset outputs (Note 1)		-0.5	(+5V _{IN} + 0.5 V) or (+3.3V _{IN} + 0.5 V) whichever is greater	V
Operating Temperature Range		-40	+85	°C
Soldering Temperature (for 10 sec)			+260	°C
Storage Temperature		-55	+125	°C
ESD rating	HBM		2	kV
	MM		200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Detailed Description

Operation Power Monitor

The ASM1834 supervisors simultaneously detect out-of-tolerance power supply conditions on both 3.3 V and 5 V power supplies. If the voltages at $5V_{IN}$ or $3.3V_{IN}$ are outside the tolerance band, the reset for the falling supply voltage becomes active. When the monitored supply returns to an intolerance state, the reset remains active for approximately 350 ms before returning to the inactive state.

On power-up, the reset signals are kept active for approximately 350 ms after the power supply voltages have reached the selected tolerance. This allows the power supply and microprocessor to stabilize before the reset is removed.

All supply current for the ASM1834 devices is drawn from the input ($5V_{IN}$ or $3.3V_{IN}$) with the highest voltage level. The outputs draw current from their input supplies $5V_{IN}$ and $3.3V_{IN}$.

Figure 3. Timing Diagram: Power Up (ASM1834D Only)

Figure 4. Timing Diagram: Power Down (ASM1834D Only)

Reset Signal Polarity and Output Stage Structure

The ASM1834 and the ASM1834A supervisors have active LOW reset signals. The ASM1834D reset outputs are active HIGH.

The ASM1834 and the ASM1834D have CMOS push-pull output stages. The ASM1834A has open drain reset outputs.

Table 5.

Part #	RESET Polarity	Output Stage Configuration
ASM1834	LOW	Push-Pull
ASM1834U	LOW	Push-Pull
ASM1834S	LOW	Push-Pull
ASM1834A	LOW	Open Drain
ASM1834AU	LOW	Open Drain
ASM1834AS	LOW	Open Drain
ASM1834D	HIGH	Push-Pull
ASM1834DU	HIGH	Push-Pull
ASM1834DS	HIGH	Push-Pull

Manual Reset Operation

Push-button switch input, $\overline{PBRST}$, allows the user to override the internal trip point detection circuits and issue reset signals. The pushbutton input is debounced and is pulled HIGH through an internal 40 k Ω resistor.

When at least one of the reset outputs is not asserted, a push button initiated reset signal can be issued by holding

$\overline{PBRST}$ LOW for at least 2 ms. When $\overline{PBRST}$ is held LOW, both resets become active and remain active for approximately 350 ms after $\overline{PBRST}$ returns HIGH. (See Figures 5 and 6.)

ASM1834, ASM1834A, ASM1834D

Reset Output Signal

Reset output signals are valid as long as either voltage at $5V_{IN}$ or $3.3V_{IN}$ is above 1.2 V. In addition, the ASM1834 has push-pull outputs that can remain valid below a 1.2 V input level. To sink current below 1.2 V, a resistor should be connected from the $\overline{RESET}$ output to ground. This resistor guarantees a valid reset signal down to 0 V. A 100 k Ω value is suggested.

The ASM1834A open drain reset outputs require pull-up resistors and must be low enough in value to pull the output

into a HIGH state. Resistor value is not critical in most applications and a value of 10 k Ω is suggested. (See *Figures 7 and 8.*)

The ASM1834A open drain reset outputs can be connected to the same potential through a single pull-up resistor. In this configuration a failure on either supply will generate an active LOW reset. If the inputs are pulled-up to different voltages, the reset outputs (pin 2 and pin 7) cannot be connected to form a wired “AND” (see *Figure 9*).

ASM1834, ASM1834A, ASM1834D

Trip Point Tolerance Selection

The 3.3VTOL and 5VTOL inputs allow independent selection of the reset trip points. If 5VTOL is connected to the 5 V supply input, a 10% tolerance is selected. If 5VTOL is grounded, a 5% tolerance is selected.

If 3.3VTOL is connected to the 3.3 V supply input, a 20% tolerance is selected. If 3.3VTOL is grounded, a 10% tolerance is selected. (Refer to Table 6.) The 3.3VTOL and 5VTOL tolerance select inputs should be tied to the ground or to the respective input supply voltage pin, 3.3VIN or 5VIN.

Table 6.

Tolerance Select	3.3 V Input				5 V Input			
	3.3 V Tolerance	TRIP Point (V)			5 V Tolerance	TRIP Point (V)		
		Min	Nom	Max		Min	Nom	Max
5VTOL = 5VIN					10%	4.25	4.38	4.49
5VTOL = GND					5%	4.5	4.63	4.75
3.3VTOL = 3.3VIN	20%	2.47	2.55	2.64				
3.3VTOL = GND	10%	2.80	2.88	2.97
