

3.3V SDRAM Buffer for Mobile PCs with 4 SO-DIMMs

Features

- One input to 10 output buffer/driver
- Supports up to four SDRAM SO-DIMMs
- Two additional outputs for feedback
- Serial interface for output control
- Low skew outputs
- Up to 133MHz operation
- Multiple V_{DD} and V_{SS} pins for noise reduction
- Dedicated OE pin for testing
- Space-saving 28 Pin SSOP package
- 3.3V operation

Functional Description

The ASM2I2310ANZ is a 3.3V buffer designed to distribute high-speed clocks in mobile PC applications. The part has 10 outputs, 8 of which can be used to drive up to four SDRAM SO-DIMMs, and the remaining can be used for external feedback to a PLL. The device operates at 3.3V and outputs can run up to 133MHz, thus making it compatible with Pentium II[®] processors.

The ASM2I2310ANZ also includes a serial interface (IIC), which can enable or disable each output clock. The IIC is Slave Receiver only and is Standard mode compliant. IIC Master can write into the IIC registers but cannot read back. The first two bytes after address should be ignored by IIC Block and data is valid after these two bytes as given in IIC Byte Flow Table. On power-up, all output clocks are enabled. A separate Output Enable pin facilitates testing on ATE.

Serial Configuration Map

- The Serial bits will be read by the clock driver in the following order:
 Byte 0 - Bits 7, 6, 5, 4, 3, 2, 1, 0
 Byte 1 - Bits 7, 6, 5, 4, 3, 2, 1, 0
 Byte N - Bits 7, 6, 5, 4, 3, 2, 1, 0
- Reserved and unused bits can be programmed to either "0" or "1".
- Serial interface address for the ASM2I2310ANZ is:

Application Information

Clock traces must be terminated with either series or parallel termination, as is normally done.

**Summary**

- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1µF. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where R_{trace} is the loaded characteristic impedance of the trace, R_{out} is the output impedance of the buffer (typically 25Ω), and R_{series} is the series terminating resistor.

$$R_{series} > R_{trace} - R_{out}$$
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7pF to 22pF.
- A Ferrite Bead may be used to isolate the Board V_{DD} from the clock generator V_{DD} island. Ensure that the Ferrite Bead offers greater than 50Ω impedance at the clock frequency, under loaded DC conditions.
- If a Ferrite Bead is used, a 10µF–22µF tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.

IIC Serial Interface Information

The information in this section assumes familiarity with IIC programming.

How to program ASM2I2310ANZ through IIC:

- Master (host) sends a start bit.
- Master (host) sends the write address D3 (H).
- ASM2I2310ANZ device will acknowledge.
- Master (host) sends the Command Byte.
- ASM2I2310ANZ device will acknowledge the Command Byte.
- Master (host) sends a Byte count
- ASM2I2310ANZ device will acknowledge the Byte count.
- Master (host) sends the Byte 0
- ASM2I2310ANZ device will acknowledge Byte 0
- Master (host) sends the Byte 1
- ASM2I2310ANZ device will acknowledge Byte 1
- Master (host) sends the Byte 2
- ASM2I2310ANZ device will acknowledge Byte 2
- Master (host) sends a Stop bit.
