## **Low Voltage 1:18 Clock Distribution Chip**

#### **Features**

- LVCMOS/LVTTL Clock Input
- 2.5V LVCMOS Outputs for Pentium II<sup>TM\*</sup> Microprocessor Support
- 150pS Maximum Targeted Output–to–Output Skew
- Maximum Output Frequency of 250MHz @ 3.3 V<sub>CC</sub>
- 32-Lead TQFP and LQFP Packaging
- Single 3.3V or 2.5V Supply.
- Pin and Function compatible to MPC942C.

#### **Functional Description**

The ASM2I9942C is a 1:18 low voltage clock distribution chip with 2.5V or 3.3V LVCMOS output capabilities. The device is offered in two versions; the ASM2I9942C has an LVCMOS input clock while the ASM2I9942P has an LVPECL input clock. The 18 outputs are 2.5V or 3.3V LVCMOS compatible and feature the drive strength to drive  $50\Omega$  series or parallel terminated transmission lines. With output–to–output skews of 200pS, the ASM2I9942C is ideal as a clock distribution chip for the most demanding of synchronous systems. The 2.5V outputs also make the

device ideal for supplying clocks for a high performance Pentium II TM microprocessor based design.

With a low output impedance ( $\approx$ 12 $\Omega$ ), in both the HIGH and LOW logic states, the output buffers of the ASM2I9942C are ideal for driving series terminated transmission lines. With an output impedance of 12 $\Omega$ , the ASM2I9942C can drive two series terminated transmission lines from each output. This capability gives the ASM2I9942C an effective fanout of 1:36. The ASM2I9942C provides enough copies of low skew clocks for most high performance synchronous systems.

The LVCMOS/LVTTL input of the ASM2I9942C provides a more standard LVCMOS interface. The OE pins will place the outputs into a high impedance state. The OE pin has an internal pullup resistor.

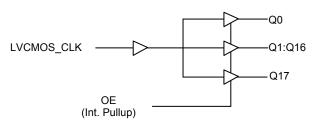

The ASM2I9942C is a single supply device. The  $V_{CC}$  power pins require either 2.5V or 3.3V. The 32–lead TQFP and LQFP package is chosen to optimize performance, board space and cost of the device. The 32–lead TQFP has a  $7x7mm^2$  body size with a conservative 0.8mm pin spacing.

# Power Consumption of the ASM2I9942C and Thermal Management

The ASM2I9942C AC specification is guaranteed for the entire operating frequency range up to 250MHz. The ASM2I9942C power consumption and the associated long-term reliability may decrease the maximum frequency limit, depending on operating conditions such as clock frequency, supply voltage, output loading, ambient temperature, vertical convection and thermal conductivity of package and board. This section describes the impact of these parameters on the junction temperature and gives a guideline to estimate the ASM2I9942C die junction temperature and the associated device reliability.

Table 8. Die junction temperature and MTBF

Junction temperature (°C)	MTBF (Years)
100	20.4
110	9.1
120	4.2
130	2.0

Increased power consumption will increase the die junction temperature and impact the device reliability (MTBF). According to the system-defined tolerable MTBF, the die junction temperature of the ASM2I9942C needs to be controlled and the thermal impedance of the board/package should be optimized. The power dissipated in the ASM2I9942C is represented in equation1.

Where  $I_{CCQ}$  is the static current consumption of the ASM2I9942C,  $C_{PD}$  is the power dissipation capacitance per output,  $(M)\Sigma C_L$  represents the external capacitive output load, N is the number of active outputs (N is always 12 in case of the ASM2I9942C). The ASM2I9942C supports driving transmission lines to maintain high signal integrity and tight timing parameters. Any transmission line will hide the lumped capacitive load at the end of the board trace, therefore,  $\Sigma C_L$  is zero for controlled transmission line systems and can be eliminated from equation 1. Using parallel termination output termination results in equation 2 for power dissipation.

In equation 2, P stands for the number of outputs with a parallel or thevenin termination.  $V_{OL}$ ,  $I_{OL}$ ,  $V_{OH}$  and  $I_{OH}$  are a function of the output termination technique and  $DC_Q$  is the clock signal duty cycle. If transmission lines are used  $\Sigma C_L$  is zero in equation 2 and can be eliminated. In general, the use of controlled transmission line techniques eliminates the impact of the lumped capacitive loads at the end lines and greatly reduces the power dissipation of the device. Equation 3 describes the die junction temperature  $T_J$  as a function of the power consumption.

Where  $R_{thja}$  is the thermal impedance of the package (junction to ambient) and  $T_A$  is the ambient temperature. According to Table 8, the junction temperature can be used to estimate the long-term device reliability. Further, combining equation 1 and equation 2 results in a maximum operating frequency for the ASM2I9942C in a series terminated transmission line system, equation 4.

$$\begin{split} P_{TOT} = & \left[ I_{CCQ} + V_{CC} \cdot f_{CLOCK} \cdot \left( N \cdot C_{PD} + \sum_{M} C_L \right) \right] \cdot V_{CC} \\ P_{TOT} = & V_{CC} \cdot \left[ I_{CCQ} + V_{CC} \cdot f_{CLOCK} \cdot \left( N \cdot C_{PD} + \sum_{M} C_L \right) \right] + \sum_{P} \left[ DC_Q \cdot I_{OH} \left( V_{CC} - V_{OH} \right) + \left( 1 - DC_Q \right) \cdot I_{OL} \cdot V_{OL} \right] \quad Equation 2 \\ T_J = & T_A + P_{TOT} \cdot R_{thja} \\ f_{CLOCKMAX} = & \frac{1}{C_{PD} \cdot N \cdot V_{CC}^2} \cdot \left[ \frac{T_{J,MAX} - T_A}{R_{thja}} - \left( I_{CCQ} \cdot V_{CC} \right) \right] \end{split} \quad Equation 4$$

May 2005 ASM2I9942C

### rev 0.2

 $T_{\rm J}$ ,MAX should be selected according to the MTBF system requirements and Table 8.  $R_{\rm thja}$  can be derived from Table 9. The  $R_{\rm thja}$  represent data based on 1S2P boards, using 2S2P boards will result in a lower thermal impedance than indicated below.

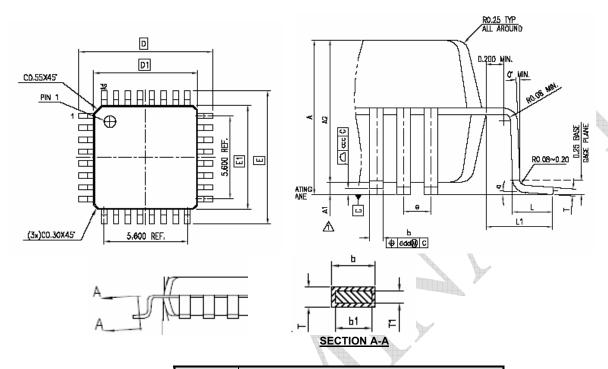

Table 9. Thermal package impedance of the 32LQFP

Convection, LFPM	R <sub>thia</sub> (1P2S board), °C/W	R <sub>thia</sub> (2P2S board), °C/W
Still air	86	61
100 Ifpm	76	56
200 Ifpm	71	54
300 Ifpm	68	53
400 Ifpm	66	52
500 Ifpm	60	49

If the calculated maximum frequency is below 350 MHz, it becomes the upper clock speed limit for the given application conditions. The following eight derating charts describe the safe frequency operation range for the ASM2I9942C. The charts were calculated for a maximum tolerable die junction temperature of 110°C (120°C), corresponding to an estimated MTBF of 9.1 years (4 years), a supply voltage of 3.3V and series terminated transmission line or capacitive loading. Depending on a given set of these operating conditions and the available device convection a decision on the maximum operating frequency can be made.
