Product Description

The ASM2P20807A is a 2.5V compatible, high speed, low noise, 1:10 fanout, non-inverting clock buffer. The large fanout from a single input reduces loading on the preceding driver and provides an efficient clock distribution network.

Providing output to output skew as low as 150pS, the ASM20807A is an ideal clock distribution device for synchronous systems. Multiple power and grounds reduce noise. Typical applications are clock and signal distribution.

- See test circuits and waveforms.
- Skew measured between all outputs under identical transitions and load conditions.
- Skew measured is difference between propagation delay times t_{PHL} and t_{PLH} of same output under identical load conditions.
- Part to part skew for all outputs given identical transitions and load conditions at identical VCC levels and temperature.
- Airflow of 1m/s is recommended for frequencies above 133MHz.
