

## Features

- High Performance, Low Power AVR<sup>®</sup>32 32-Bit Microcontroller
  - 210 DMIPS throughput at 150 MHz
  - 16 KB instruction cache and 16 KB data caches
  - Memory Management Unit enabling use of operating systems
  - Single-cycle RISC instruction set including SIMD and DSP instructions
  - Java Hardware Acceleration
- Multimedia Co-Processor
  - Vector Multiplication Unit for video acceleration through color-space conversion (YUV<->RGB), image scaling and filtering, quarter pixel motion compensation
- Multi-hierarchy bus system
  - High-performance data transfers on separate buses for increased performance
- Data Memories
  - 32KBytes SRAM
- External Memory Interface
  - SDRAM, DataFlash<sup>™</sup>, SRAM, Multi Media Card (MMC), Secure Digital (SD), Compact Flash, Smart Media, NAND Flash
- Direct Memory Access Controller
  - External Memory access without CPU intervention
- Interrupt Controller
  - Individually maskable Interrupts
  - Each interrupt request has a programmable priority and autovector address
- System Functions
  - Power and Clock Manager
  - Crystal Oscillator with Phase-Lock-Loop (PLL)
  - Watchdog Timer
  - Real-time Clock
- 6 Multifunction timer/counters
  - Three external clock inputs, I/O pins, PWM, capture and various counting capabilities
- 4 Universal Synchronous/Asynchronous Receiver/Transmitters (USART)
  - 115.2 kbps IrDA Modulation and Demodulation
  - Hardware and software handshaking
- 3 Synchronous Serial Protocol controllers
  - Supports I2S, SPI and generic frame-based protocols
- Two-Wire Interface
  - Sequential Read/Write Operations, Philips' I2C<sup>®</sup> compatible
- Liquid Crystal Display (LCD) interface
  - Supports TFT displays
  - Configurable pixel resolution supporting QCIF/QVGA/VGA/SVGA configurations.
- Image Sensor Interface
  - 12-bit Data Interface for CMOS cameras
- Universal Serial Bus (USB) 2.0 High Speed (480 Mbps) Device
  - On-chip Transceivers with physical interface
- 16-bit stereo audio DAC
  - Sample rates up to 50 kHz
- On-Chip Debug System
  - Nexus Class 3
  - Full speed, non-intrusive data and program trace
  - Runtime control and JTAG interface
- Package/Pins
  - AT32AP7002: 196-ball CTBGA
- Power supplies
  - 1.65V to 1.95V VDDCORE
  - 3.0V to 3.6V VDDIO

## AVR<sup>®</sup>32 32-bit Microcontroller

AT32AP7002

Preliminary

Summary

32054AS-AVR32-02/07

## 1. Part Description

The AT32AP7002 is a complete System-on-chip application processor with an AVR32 RISC processor achieving 210 DMIPS running 150 MHz. AVR32 is a high-performance 32-bit RISC microprocessor core, designed for cost-sensitive embedded applications, with particular emphasis on low power consumption, high code density and high application performance.

AT32AP7002 implements a Memory Management Unit (MMU) and a flexible interrupt controller supporting modern operating systems and real-time operating systems. The processor also includes a rich set of DSP and SIMD instructions, specially designed for multimedia and telecom applications.

AT32AP7002 incorporates SRAM memories on-chip for fast and secure access. For applications requiring additional memory, external 16-bit SRAM is accessible. Additionally, an SDRAM controller provides off-chip volatile memory access as well as controllers for all industry standard off-chip non-volatile memories, like Compact Flash, Multi Media Card (MMC), Secure Digital (SD)-card, SmartCard, NAND Flash and Atmel DataFlash™.

The Direct Memory Access controller for all the serial peripherals enables data transfer between memories without processor intervention. This reduces the processor overhead when transferring continuous and large data streams between modules in the MCU.

The Timer/Counters includes three identical 16-bit timer/counter channels. Each channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

AT32AP7002 also features an onboard LCD Controller, supporting single and double scan monochrome and color passive STN LCD modules and single scan active TFT LCD modules. On monochrome STN displays, up to 16 gray shades are supported using a time-based dithering algorithm and Frame Rate Control (FRC) method. This method is also used in color STN displays to generate up to 4096 colors.

The LCD Controller is programmable for supporting resolutions up to 2048 x 2048 with a pixel depth from 1 to 24 bits per pixel.

A pixel co-processor provides color space conversions for images and video, in addition to a wide variety of hardware filter support

The media-independent interface (MII) and reduced MII (RMII) 10/100 Ethernet MAC modules provides on-chip solutions for network-connected devices.

Synchronous Serial Controllers provide easy access to serial communication protocols, audio standards like AC'97, I2S, I2C© and various SPI modes. The modules support frame-based protocols, like VoIP SIP protocols.

The Java hardware acceleration implementation in AVR32 allows for a very high-speed Java byte-code execution. AVR32 implements Java instructions in hardware, reusing the existing RISC data path, which allows for a near-zero hardware overhead and cost with a very high performance.

The Image Sensor Interface supports cameras with up to 12-bit data buses and connects directly to the LCD interface through a separate bus.

PS2 connectivity is provided for standard input devices like mice and keyboards.

AT32AP7002 integrates a class 3 Nexus 2.0 On-Chip Debug (OCD) System, with non-intrusive real-time trace, full-speed read/write memory access in addition to basic runtime control.

The C-compiler is closely linked to the architecture and is able to utilize code optimization features, both for size and speed.

## 2. Blockdiagram

Figure 2-1. Blockdiagram

## 2.1 Processor and architecture

### 2.1.1 AVR32AP CPU

- 32-bit load/store AVR32B RISC architecture.
  - Up to 15 general-purpose 32-bit registers.
  - 32-bit Stack Pointer, Program Counter and Link Register reside in register file.
  - Fully orthogonal instruction set.
  - Privileged and unprivileged modes enabling efficient and secure Operating Systems.
  - Innovative instruction set together with variable instruction length ensuring industry leading code density.
  - DSP extension with saturating arithmetic, and a wide variety of multiply instructions.
  - SIMD extension for media applications.
- 7 stage pipeline allows one instruction per clock cycle for most instructions.
  - Java Hardware Acceleration.
  - Byte, half-word, word and double word memory access.
  - Unaligned memory access.
  - Shadowed interrupt context for INT3 and multiple interrupt priority levels.
  - Dynamic branch prediction and return address stack for fast change-of-flow.
  - Coprocessor interface.
- Full MMU allows for operating systems with memory protection.
- 16Kbyte Instruction and 16Kbyte data caches.
  - Virtually indexed, physically tagged.
  - 4-way associative.
  - Write-through or write-back.
- Nexus Class 3 On-Chip Debug system.
  - Low-cost NanoTrace supported.

### 2.1.2 Pixel Coprocessor (PiCo)

- Coprocessor coupled to the AVR32 CPU Core through the TCB Bus.
- Three parallel Vector Multiplication Units (VMU) where each unit can:
  - Multiply three pixel components with three coefficients.
  - Add the products from the multiplications together.
  - Accumulate the result or add an offset to the sum of the products.
- Can be used for accelerating:
  - Image Color Space Conversion.
    - Configurable Conversion Coefficients.
    - Supports packed and planar input and output formats.
    - Supports subsampled input color spaces (i.e 4:2:2, 4:2:0).
  - Image filtering/scaling.
    - Configurable Filter Coefficients.
    - Throughput of one sample per cycle for a 9-tap FIR filter.
    - Can use the built-in accumulator to extend the FIR filter to more than 9-taps.
    - Can be used for bilinear/bicubic interpolations.
  - MPEG-4/H.264 Quarter Pixel Motion Compensation.
- Flexible input Pixel Selector.
  - Can operate on numerous different image storage formats.
- Flexible Output Pixel Inserter.
  - Scales and saturates the results back to 8-bit pixel values.

- Supports packed and planar output formats.
- Configurable coefficients with flexible fixed-point representation.

### 2.1.3 Debug and Test system

- IEEE1149.1 compliant JTAG and boundary scan
- Direct memory access and programming capabilities through JTAG interface
- Extensive On-Chip Debug features in compliance with IEEE-ISTO 5001-2003 (Nexus 2.0) Class 3
- Auxiliary port for high-speed trace information
- Hardware support for 6 Program and 2 data breakpoints
- Unlimited number of software breakpoints supported
- Advanced Program, Data, Ownership, and Watchpoint trace supported

### 2.1.4 DMA controller

- 2 HSB Master Interfaces
- 3 Channels
- Software and Hardware Handshaking Interfaces
  - 11 Hardware Handshaking Interfaces
- Memory/Non-Memory Peripherals to Memory/Non-Memory Peripherals Transfer
- Single-block DMA Transfer
- Multi-block DMA Transfer
  - Linked Lists
  - Auto-Reloading
  - Contiguous Blocks
- DMA Controller is Always the Flow Controller
- Additional Features
  - Scatter and Gather Operations
  - Channel Locking
  - Bus Locking
  - FIFO Mode
  - Pseudo Fly-by Operation

### 2.1.5 Peripheral DMA Controller

- Transfers from/to peripheral to/from any memory space without intervention of the processor.
- Next Pointer Support, forbids strong real-time constraints on buffer management.
- Eighteen channels
  - Two for each USART
  - Two for each Serial Synchronous Controller
  - Two for each Serial Peripheral Interface

### 2.1.6 Bus system

- HSB bus matrix with 10 Masters and 8 Slaves handled
  - Handles Requests from the CPU Icache, CPU Dcache, HSB bridge, HISI, USB 2.0 Controller, LCD Controller, DMA Controller 0, DMA Controller 1, and to internal SRAM 0, internal SRAM 1, PB A, PB B, EBI and, USB.

- Round-Robin Arbitration (three modes supported: no default master, last accessed default master, fixed default master)
- Burst Breaking with Slot Cycle Limit
- One Address Decoder Provided per Master
- 2 Peripheral buses allowing each bus to run on different bus speeds.
  - PB A intended to run on low clock speeds, with peripherals connected to the PDC.
  - PB B intended to run on higher clock speeds, with peripherals connected to the DMAC.
- HSB-HSB Bridge providing a low-speed HSB bus running at the same speed as PBA
  - Allows PDC transfers between a low-speed PB bus and a bus matrix of higher clock speeds

An overview of the bus system is given in [Figure 2-1 on page 4](#). All modules connected to the same bus use the same clock, but the clock to each module can be individually shut off by the Power Manager. The figure identifies the number of master and slave interfaces of each module connected to the HSB bus, and which DMA controller is connected to which peripheral.

2.2 Package and Pinout AVR32AP7002

## 3. Signals Description

The following table gives details on the signal name classified by peripheral. The pinout multiplexing of these signals is given in the Peripheral Muxing table in the Peripherals chapter.

**Table 3-1.** Signal Description List

| Signal Name                           | Function                | Type   | Active Level | Comments       |
|---------------------------------------|-------------------------|--------|--------------|----------------|
| <b>Power</b>                          |                         |        |              |                |
| AVDDPLL                               | PLL Power Supply        | Power  |              | 1.65 to 1.95 V |
| AVDDUSB                               | USB Power Supply        | Power  |              | 1.65 to 1.95 V |
| AVDDOSC                               | Oscillator Power Supply | Power  |              | 1.65 to 1.95 V |
| VDDCORE                               | Core Power Supply       | Power  |              | 1.65 to 1.95 V |
| VDDIO                                 | I/O Power Supply        | Power  |              | 3.0 to 3.6V    |
| AGNDPLL                               | PLL Ground              | Ground |              |                |
| AGNDUSB                               | USB Ground              | Ground |              |                |
| AGNDOSC                               | Oscillator Ground       | Ground |              |                |
| GND                                   | Ground                  | Ground |              |                |
| <b>Clocks, Oscillators, and PLL's</b> |                         |        |              |                |
| XIN0, XIN1, XIN32                     | Crystal 0, 1, 32 Input  | Analog |              |                |
| XOUT0, XOUT1, XOUT32                  | Crystal 0, 1, 32 Output | Analog |              |                |
| PLL0, PLL1                            | PLL 0,1 Filter Pin      | Analog |              |                |
| <b>JTAG</b>                           |                         |        |              |                |
| TCK                                   | Test Clock              | Input  |              |                |
| TDI                                   | Test Data In            | Input  |              |                |
| TDO                                   | Test Data Out           | Output |              |                |
| TMS                                   | Test Mode Select        | Input  |              |                |
| TRST_N                                | Test Reset              | Input  | Low          |                |
| <b>Auxiliary Port - AUX</b>           |                         |        |              |                |
| MCKO                                  | Trace Data Output Clock | Output |              |                |
| MDO0 - MDO5                           | Trace Data Output       | Output |              |                |
| MSEO0 - MSEO1                         | Trace Frame Control     | Output |              |                |
| EVTI_N                                | Event In                | Input  | Low          |                |

**Table 3-1.** Signal Description List

| Signal Name                            | Function                          | Type   | Active Level | Comments |
|--|-----------------------------------|--------|--------------|----------|
| EVTO_N                                 | Event Out                         | Output | Low          |          |
| <b>Power Manager - PM</b>              |                                   |        |              |          |
| GCLK0 - GCLK4                          | Generic Clock Pins                | Output |              |          |
| OSCE_N                                 | Oscillator Enable                 | Input  | Low          |          |
| RESET_N                                | Reset Pin                         | Input  | Low          |          |
| WAKE_N                                 | Wake Pin                          | Input  | Low          |          |
| <b>External Interrupt Module - EIM</b> |                                   |        |              |          |
| EXTINT0 - EXTINT3                      | External Interrupt Pins           | Input  |              |          |
| NMI_N                                  | Non-Maskable Interrupt Pin        | Input  | Low          |          |
| <b>AC97 Controller - AC97C</b>         |                                   |        |              |          |
| SCLK                                   | AC97 Clock Signal                 | Input  |              |          |
| SDI                                    | AC97 Receive Signal               | Output |              |          |
| SDO                                    | AC97 Transmit Signal              | Output |              |          |

| CLOCK0 - CLOCK1   | PS2 Clock                    | Input  |              |          |
| DATA0 - DATA1   | PS2 Data                     | I/O    |              |          |

**Table 3-1.** Signal Description List

| Signal Name   | Function                       | Type   | Active Level | Comments |
|---|--------------------------------|--------|--------------|----------|
| <b>Serial Peripheral Interface - SPI0, SPI1</b>   |                                |        |              |          |
| MISO  | Master In Slave Out            | I/O    |              |          |
| MOSI  | Master Out Slave In            | I/O    |              |          |
| NPCS0 - NPCS3   | SPI Peripheral Chip Select     | I/O    | Low          |          |
| SCK   | Clock                          | Output |              |          |
| <b>Synchronous Serial Controller - SSC0, SSC1, SSC2</b>   |                                |        |              |          |
| RX_CLOCK  | SSC Receive Clock              | I/O    |              |          |
| RX_DATA   | SSC Receive Data               | Input  |              |          |
| RX_FRAME_SYNC   | SSC Receive Frame Sync         | I/O    |              |          |
| TX_CLOCK  | SSC Transmit Clock             | I/O    |              |          |
| TX_DATA   | SSC Transmit Data              | Output |              |          |
| TX_FRAME_SYNC   | SSC Transmit Frame Sync        | I/O    |              |          |
| <b>DMA Controller - DMAC</b>  |                                |        |              |          |
| DMARQ0 - DMARQ3   | DMA Requests                   | Input  |              |          |
| <b>Timer/Counter - TIMER0, TIMER1</b>   |                                |        |              |          |
| A0  | Channel 0 Line A               | I/O    |              |          |
| A1  | Channel 1 Line A               | I/O    |              |          |
| A2  | Channel 2 Line A               | I/O    |              |          |
| B0  | Channel 0 Line B               | I/O    |              |          |
| B1  | Channel 1 Line B               | I/O    |              |          |
| B2  | Channel 2 Line B               | I/O    |              |          |
| CLK0  | Channel 0 External Clock Input | Input  |              |          |
| CLK1  | Channel 1 External Clock Input | Input  |              |          |
| CLK2  | Channel 2 External Clock Input | Input  |              |          |
| <b>Two-wire Interface - TWI</b>   |                                |        |              |          |
| SCL   | Serial Clock                   | I/O    |              |          |
| SDA   | Serial Data                    | I/O    |              |          |
| <b>Universal Synchronous Asynchronous Receiver Transmitter - USART0, USART1, USART2, USART3</b> |                                |        |              |          |

**Table 3-1.** Signal Description List

| Signal Name                              | Function               | Type   | Active Level | Comments   |
|--|------------------------|--------|--------------|--|
| CLK                                      | Clock                  | I/O    |              |  |
| CTS                                      | Clear To Send          | Input  |              |  |
| RTS                                      | Request To Send        | Output |              |  |
| RXD                                      | Receive Data           | Input  |              |  |
| TXD                                      | Transmit Data          | Output |              |  |
| <b>Pulse Width Modulator - PWM</b>       |                        |        |              |  |
| PWM0 - PWM3                              | PWM Output Pins        | Output |              |  |
| <b>Universal Serial Bus Device - USB</b> |                        |        |              |  |
| DDM                                      | USB Device Port Data - | Analog |              |  |
| DDP                                      | USB Device Port Data + | Analog |              |  |
| VBG                                      | USB bandgap            | Analog |              | Connected to a 6810 Ohm $\pm$ 0.5% resistor to ground and a 10 pF capacitor to ground. |

## 4. Power Considerations

### 4.1 Power Supplies

The AT32AP7002 has several types of power supply pins:

- **VDDCORE pins:** Power the core, memories, and peripherals. Voltage is 1.8V nominal.
- **VDDIO pins:** Power I/O lines. Voltage is 3.3V nominal.
- **VDDPLL pin:** Powers the PLL. Voltage is 1.8V nominal.
- **VDDUSB pin:** Powers the USB. Voltage is 1.8V nominal.
- **VDDOSC pin:** Powers the oscillators. Voltage is 1.8V nominal.

The ground pins GND are common to VDDCORE and VDDIO. The ground pin for VDDPLL is GNDPLL, and the GND pin for VDDOSC is GNDOSC.

See "Electrical Characteristics" on page 928 for power consumption on the various supply pins.

### 4.2 Power Supply Connections

Special considerations should be made when connecting the power and ground pins on a PCB. Figure 4-1 shows how this should be done.

Figure 4-1. Connecting analog power supplies

## **5. I/O Line Considerations**

### **5.1 JTAG pins**

The TMS, TDI and TCK pins have pull-up resistors. TDO is an output, driven at up to VDDIO, and have no pull-up resistor. The TRST\_N pin is used to initialize the embedded JTAG TAP Controller when asserted at a low level. It is a schmitt input and integrates permanent pull-up resistor to VDDIO, so that it can be left unconnected for normal operations.

### **5.2 WAKE\_N pin**

The WAKE\_N pin is a schmitt trigger input integrating a permanent pull-up resistor to VDDIO.

### **5.3 RESET\_N pin**

The RESET\_N pin is a schmitt input and integrates a permanent pull-up resistor to VDDIO. As the product integrates a power-on reset cell, the RESET\_N pin can be left unconnected in case no reset from the system needs to be applied to the product.

### **5.4 EVTI\_N pin**

The EVTI\_N pin is a schmitt input and integrates a non-programmable pull-up resistor to VDDIO.

### **5.5 TWI pins**

When these pins are used for TWI, the pins are open-drain outputs with slew-rate limitation and inputs with inputs with spike-filtering. When used as GPIO-pins or used for other peripherals, the pins have the same characteristics as PIO pins.

### **5.6 PIO pins**

All the I/O lines integrate a programmable pull-up resistor. Programming of this pull-up resistor is performed independently for each I/O line through the PIO Controllers. After reset, I/O lines default as inputs with pull-up resistors enabled, except when indicated otherwise in the column “Reset State” of the PIO Controller multiplexing tables.

## 6. Memories

### 6.1 Embedded Memories

- 32 Kbyte SRAM
  - Implemented as two 16Kbyte blocks
  - Single cycle access at full bus speed

### 6.2 Physical Memory Map

The system bus is implemented as an HSB bus matrix. All system bus addresses are fixed, and they are never remapped in any way, not even in boot. Note that AT32AP7002 by default uses segment translation, as described in the AVR32 Architecture Manual. The 32 bit physical address space is mapped as follows:

**Table 6-1.** AT32AP7002 Physical Memory Map

| Start Address | Size      | Device             |
|---------------|-----------|--------------------|
| 0x0000_0000   | 64 Mbyte  | EBI SRAM CS0       |
| 0x0400_0000   | 64 Mbyte  | EBI SRAM CS4       |
| 0x0800_0000   | 64 Mbyte  | EBI SRAM CS2       |
| 0x0C00_0000   | 64 Mbyte  | EBI SRAM CS3       |
| 0x1000_0000   | 256 Mbyte | EBI SRAM/SDRAM CS1 |
| 0x2000_0000   | 64 Mbyte  | EBI SRAM CS5       |
| 0x2400_0000   | 16 Kbyte  | Internal SRAM 0    |
| 0x2400_4000   | 16 Kbyte  | Internal SRAM1     |
| 0xFF00_0000   | 4 Kbyte   | LCDC configuration |
| 0xFF20_0000   | 1 KByte   | DMAC configuration |
| 0xFF30_0000   | 1 MByte   | USB Data           |
| 0xFFE0_0000   | 1 MByte   | PBA                |
| 0xFFFF0_0000  | 1 MByte   | PBB                |

Accesses to unused areas returns an error result to the master requesting such an access.

The bus matrix has the several masters and slaves. Each master has its own bus and its own decoder, thus allowing a different memory mapping per master. The master number in the table below can be used to index the HMATRIX control registers. For example, MCFG2 is associated with the HSB-HSB bridge.

**Table 6-2.** HSB masters

|          |                         |
|----------|-------------------------|
| Master 0 | CPU Dcache              |
| Master 1 | CPU Icache              |
| Master 2 | HSB-HSB Bridge          |
| Master 3 | ISI DMA                 |
| Master 4 | USB DMA                 |
| Master 5 | LCD Controller DMA      |
| Master 6 | Ethernet MAC0 DMA       |
| Master 7 | Ethernet MAC1 DMA       |
| Master 8 | DMAC Master Interface 0 |
| Master 9 | DMAC Master Interface 1 |

Each slave has its own arbiter, thus allowing a different arbitration per slave. The slave number in the table below can be used to index the HMATRIX control registers. For example, SCFG3 is associated with PBB.

**Table 6-3.** HSB slaves

|         |                    |
|---------|--------------------|
| Slave 0 | Internal SRAM 0    |
| Slave 1 | Internal SRAM1     |
| Slave 2 | PBA                |
| Slave 3 | PBB                |
| Slave 4 | EBI                |
| Slave 5 | USB data           |
| Slave 6 | LCDC configuration |
| Slave 7 | DMAC configuration |

## 7. Peripherals

### 7.1 Peripheral address map

**Table 7-1.** Peripheral Address Mapping

| Address    | Peripheral Name  | Bus  |
|------------|--|------|
| 0xFF000000 | LCDC<br>LCD Controller Slave Interface - LCDC                              | HSB  |
| 0xFF200000 | DMAC<br>DMA Controller Slave Interface- DMAC                               | HSB  |
| 0xFF300000 | USB<br>USB 2.0 Slave Interface - USB                                       | HSB  |
| 0xFFE00000 | SPI0<br>Serial Peripheral Interface - SPI0                                 | PB A |
| 0xFFE00400 | SPI1<br>Serial Peripheral Interface - SPI1                                 | PB A |
| 0xFFE00800 | TWI<br>Two-wire Interface - TWI  | PB A |
| 0xFFE00C00 | USART0<br>Universal Synchronous Asynchronous Receiver Transmitter - USART0 | PB A |
| 0xFFE01000 | USART1<br>Universal Synchronous Asynchronous Receiver Transmitter - USART1 | PB A |

## 7.2 Interrupt Request Signal Map

The various modules may output interrupt request signals. These signals are routed to the Interrupt Controller (INTC). The Interrupt Controller supports up to 64 groups of interrupt requests. Each group can have up to 32 interrupt request signals. All interrupt signals in the same group share the same autovector address and priority level. Refer to the documentation for the individual submodules for a description of the semantic of the different interrupt requests.

The interrupt request signals in AT32AP7002 are connected to the INTC as follows:

**Table 7-2.** Interrupt Request Signal Map

| Group | Line | Signal                       |
|-------|------|------------------------------|
| 0     | 0    | COUNT-COMPARE match          |
|       | 1    | Performance Counter Overflow |
| 1     | 0    | LCDC EOF                     |
|       | 1    | LCDC LN                      |
|       | 2    | LCDC LSTLN                   |
|       | 3    | LCDC MER                     |
|       | 4    | LCDC OWR                     |
|       | 5    | LCDC UFLW                    |
| 2     | 0    | DMAC BLOCK                   |
|       | 1    | DMAC DSTT                    |
|       | 2    | DMAC ERR                     |
|       | 3    | DMAC SRCT                    |
|       | 4    | DMAC TFR                     |
| 3     | 0    | SPI 0                        |
| 4     | 0    | SPI 1                        |
| 5     | 0    | TWI                          |
| 6     | 0    | USART0                       |

| 21    | 0    | RTC                          |

**Table 7-2.** Interrupt Request Signal Map

| Group | Line | Signal |
|-------|------|--------|
| 22    | 0    | TC00   |
|       | 1    | TC01   |
|       | 2    | TC02   |
| 23    | 0    | TC10   |
|       | 1    | TC11   |
|       | 2    | TC12   |
| 24    | 0    | PWM    |
| 27    | 0    | DAC    |
| 28    | 0    | MCI    |
| 29    | 0    | AC97C  |
| 30    | 0    | ISI    |
| 31    | 0    | USB    |
| 32    | 0    | EBI    |

### 7.3 DMAC Handshake Interface Map

The following table details the hardware handshake map between the DMAC and the peripherals attached to it :

**Table 7-3.** Hardware Handshaking Connection

| Request                | Hardware Handshaking Interface |
|------------------------|--------------------------------|
| MCI RX                 | 0                              |
| MCI TX                 | 1                              |
| DAC TX                 | 2                              |
| AC97C CHANNEL A RX     | 3                              |
| AC97C CHANNEL A TX     | 4                              |
| AC97C CHANNEL B RX     | 5                              |
| AC97C CHANNEL B TX     | 6                              |
| EXTERNAL DMA REQUEST 0 | 7                              |
| EXTERNAL DMA REQUEST 1 | 8                              |
| EXTERNAL DMA REQUEST 2 | 9                              |
| EXTERNAL DMA REQUEST 3 | 10                             |

## 7.4 Clock Connections

### 7.4.1 Timer/Counters

Each Timer/Counter channel can independently select an internal or external clock source for its counter:

**Table 7-4.** Timer/Counter clock connections

| Timer/Counter | Source   | Name         | Connection                      |
|---------------|----------|--------------|---------------------------------|
| 0             | Internal | TIMER_CLOCK1 | clk_slow                        |
|               |          | TIMER_CLOCK2 | clk_pbb / 4                     |
|               |          | TIMER_CLOCK3 | clk_pbb / 8                     |
|               |          | TIMER_CLOCK4 | clk_pbb / 16                    |
|               |          | TIMER_CLOCK5 | clk_pbb / 32                    |
|               | External | XC0          | See <a href="#">Section 7.7</a> |
|               |          | XC1          |                                 |
|               |          | XC2          |                                 |
| 1             | Internal | TIMER_CLOCK1 | clk_slow                        |
|               |          | TIMER_CLOCK2 | clk_pbb / 4                     |
|               |          | TIMER_CLOCK3 | clk_pbb / 8                     |
|               |          | TIMER_CLOCK4 | clk_pbb / 16                    |
|               |          | TIMER_CLOCK5 | clk_pbb / 32                    |
|               | External | XC0          | See <a href="#">Section 7.7</a> |
|               |          | XC1          |                                 |
|               |          | XC2          |                                 |

### 7.4.2 USARTs

Each USART can be connected to an internally divided clock:

**Table 7-5.** USART clock connections

| USART | Source   | Name    | Connection  |
|-------|----------|---------|-------------|
| 0     | Internal | CLK_DIV | clk_pba / 8 |
| 1     |          |         |             |
| 2     |          |         |             |
| 3     |          |         |             |

7.4.3 SPIs

Each SPI can be connected to an internally divided clock:

**Table 7-6.** SPI clock connections

| SPI | Source   | Name    | Connection   |
|-----|----------|---------|--------------|
| 0   | Internal | CLK_DIV | clk_pba / 32 |
| 1   |          |         |              |

7.5 External Interrupt Pin Mapping

External interrupt requests are connected to the following pins::

**Table 7-7.** External Interrupt Pin Mapping

| Source  | Connection |
|---------|------------|
| NMI_N   | PB24       |
| EXTINT0 | PB25       |
| EXTINT1 | PB26       |
| EXTINT2 | PB27       |
| EXTINT3 | PB28       |

7.6 Nexus OCD AUX port connections

If the OCD trace system is enabled, the trace system will take control over a number of pins, irrespectively of the PIO configuration. Two different OCD trace pin mappings are possible, depending on the configuration of the OCD AXS register. For details, see the *AVR32 AP Technical Reference Manual*.

**Table 7-8.** Nexus OCD AUX port connections

| Pin     | AXS=0  | AXS=1  |
|---------|--------|--------|
| EVTI_N  | EVTI_N | EVTI_N |
| MDO[5]  | PB09   | PC18   |
| MDO[4]  | PB08   | PC14   |
| MDO[3]  | PB07   | PC12   |
| MDO[2]  | PB06   | PC11   |
| MDO[1]  | PB05   | PC06   |
| MDO[0]  | PB04   | PC05   |
| EVTO_N  | PB03   | PB28   |
| MCKO    | PB02   | PC02   |
| MSEO[1] | PB01   | PC01   |
| MSEO[0] | PB00   | PC00   |

## 7.7 Peripheral Multiplexing on IO lines

The AT32AP7002 features five PIO controllers, PIOA to PIOE, that multiplex the I/O lines of the peripheral set. Each PIO Controller controls up to thirty-two lines.

Each line can be assigned to one of two peripheral functions, A or B. The tables in the following pages define how the I/O lines of the peripherals A and B are multiplexed on the PIO Controllers.

Note that some output only peripheral functions might be duplicated within the tables.

### 7.7.1 PIO Controller A Multiplexing

**Table 7-9.** PIO Controller A Multiplexing

| I/O Line | Peripheral A         | Peripheral B         |
|----------|----------------------|----------------------|
| PA00     | SPI0 - MISO          | SSC1 - RX_FRAME_SYNC |
| PA01     | SPI0 - MOSI          | SSC1 - TX_FRAME_SYNC |
| PA02     | SPI0 - SCK           | SSC1 - TX_CLOCK      |
| PA03     | SPI0 - NPCS[0]       | SSC1 - RX_CLOCK      |
| PA04     | SPI0 - NPCS[1]       | SSC1 - TX_DATA       |
| PA05     | SPI0 - NPCS[2]       | SSC1 - RX_DATA       |
| PA06     | TWI - SDA            | USART0 - RTS         |
| PA07     | TWI - SCL            | USART0 - CTS         |
| PA08     | PSIF - CLOCK         | USART0 - RXD         |
| PA09     | PSIF - DATA          | USART0 - TXD         |
| PA10     | MCI - CLK            | USART0 - CLK         |
| PA11     | MCI - CMD            | TC0 - CLK0           |
| PA12     | MCI - DATA[0]        | TC0 - A0             |
| PA13     | MCI - DATA[1]        | TC0 - A1             |
| PA14     | MCI - DATA[2]        | TC0 - A2             |
| PA15     | MCI - DATA[3]        | TC0 - B0             |
| PA16     | USART1 - CLK         | TC0 - B1             |
| PA17     | USART1 - RXD         | TC0 - B2             |
| PA18     | USART1 - TXD         | TC0 - CLK2           |
| PA19     | USART1 - RTS         | TC0 - CLK1           |
| PA20     | USART1 - CTS         | SPI0 - NPCS[3]       |
| PA21     | SSC0 - RX_FRAME_SYNC | PWM - PWM[2]         |
| PA22     | SSC0 - RX_CLOCK      | PWM - PWM[3]         |
| PA23     | SSC0 - TX_CLOCK      | TC1 - A0             |
| PA24     | SSC0 - TX_FRAME_SYNC | TC1 - A1             |
| PA25     | SSC0 - TX_DATA       | TC1 - B0             |
| PA26     | SSC0 - RX_DATA       | TC1 - B1             |
| PA27     | SPI1 - NPCS[3]       | TC1 - CLK0           |
| PA28     | PWM - PWM[0]         | TC1 - A2             |

**Table 7-9.** PIO Controller A Multiplexing

|      |              |            |
|------|--------------|------------|
| PA29 | PWM - PWM[1] | TC1 - B2   |
| PA30 | SM - GCLK[0] | TC1 - CLK1 |
| PA31 | SM - GCLK[1] | TC1 - CLK2 |

## 7.7.2 PIO Controller B Multiplexing

**Table 7-10.** PIO Controller B Multiplexing

| I/O Line | Peripheral A         | Peripheral B    |
|----------|----------------------|-----------------|
| PB00     | ISI - DATA[0]        | SPI1 - MISO     |
| PB01     | ISI - DATA[1]        | SPI1 - MOSI     |
| PB02     | ISI - DATA[2]        | SPI1 - NPCS[0]  |
| PB03     | ISI - DATA[3]        | SPI1 - NPCS[1]  |
| PB04     | ISI - DATA[4]        | SPI1 - NPCS[2]  |

## 7.7.3 PIO Controller C Multiplexing

**Table 7-11.** PIO Controller C Multiplexing

| I/O Line | Peripheral A   | Peripheral B |
|----------|----------------|--------------|
| PC20     | LCDC - HSYNC   |              |
| PC21     | LCDC - PCLK    |              |
| PC22     | LCDC - VSYNC   |              |
| PC23     | LCDC - DVAL    |              |
| PC28     | LCDC - DATA[2] |              |
| PC29     | LCDC - DATA[3] |              |
| PC30     | LCDC - DATA[4] |              |
| PC31     | LCDC - DATA[5] |              |

## 7.7.4 PIO Controller D Multiplexing

**Table 7-12.** PIO Controller D Multiplexing

| I/O Line | Peripheral A    | Peripheral B |
|----------|-----------------|--------------|
| PD00     | LCDC - DATA[6]  |              |
| PD01     | LCDC - DATA[7]  |              |
| PD04     | LCDC - DATA[10] |              |
| PD05     | LCDC - DATA[11] |              |
| PD06     | LCDC - DATA[12] |              |
| PD07     | LCDC - DATA[13] |              |
| PD08     | LCDC - DATA[14] |              |
| PD09     | LCDC - DATA[15] |              |
| PD12     | LCDC - DATA[18] |              |
| PD13     | LCDC - DATA[19] |              |
| PD14     | LCDC - DATA[20] |              |
| PD15     | LCDC - DATA[21] |              |
| PD16     | LCDC - DATA[22] |              |
| PD17     | LCDC - DATA[23] |              |

## 7.7.5 IO Pins Without Multiplexing

Many of the external EBI pins are not controlled by the PIO modules, but directly driven by the EBI. These pins have programmable pullup resistors. These resistors are controlled by Special Function Register 4 (SFR4) in the HMATRIX. The pullup on the lines multiplexed with PIO is controlled by the appropriate PIO control register.

This SFR can also control CompactFlash, SmartMedia or NandFlash Support, see the EBI chapter for details

### 7.7.5.1 HMatrix SFR4 EBI Control Register

**Name:** HMATRIX\_SFR4

**Access Type:** Read/Write

|    |    |          |          |          |    |          |           |
|----|----|----------|----------|----------|----|----------|-----------|
| 31 | 30 | 29       | 28       | 27       | 26 | 25       | 24        |
| -  | -  | -        | -        | -        | -  | -        | -         |
| 23 | 22 | 21       | 20       | 19       | 18 | 17       | 16        |
| -  | -  | -        | -        | -        | -  | -        | -         |
| 15 | 14 | 13       | 12       | 11       | 10 | 9        | 8         |
| -  | -  | -        | -        | -        | -  | -        | EBI_DBPUC |
| 7  | 6  | 5        | 4        | 3        | 2  | 1        | 0         |
| -  | -  | EBI_CS5A | EBI_CS4A | EBI_CS3A | -  | EBI_CS1A | -         |

- **CS1A: Chip Select 1 Assignment**

0 = Chip Select 1 is assigned to the Static Memory Controller.

1 = Chip Select 1 is assigned to the SDRAM Controller.

- **CS3A: Chip Select 3 Assignment**

0 = Chip Select 3 is only assigned to the Static Memory Controller and NCS3 behaves as defined by the SMC.

1 = Chip Select 3 is assigned to the Static Memory Controller and the NAND Flash/SmartMedia Logic is activated.

- **CS4A: Chip Select 4 Assignment**

0 = Chip Select 4 is assigned to the Static Memory Controller and NCS4, NCS5 and NCS6 behave as defined by the SMC.

1 = Chip Select 4 is assigned to the Static Memory Controller and the CompactFlash Logic is activated.

- **CS5A: Chip Select 5 Assignment**

0 = Chip Select 5 is assigned to the Static Memory Controller and NCS4, NCS5 and NCS6 behave as defined by the SMC.

1 = Chip Select 5 is assigned to the Static Memory Controller and the CompactFlash Logic is activated.

Accessing the address space reserved to NCS5 and NCS6 may lead to an unpredictable outcome.

- **EBI\_DBPUC: EBI Data Bus Pull-up Control**

0: EBI D[15:0] are internally pulled up to the VDDIO power supply. The pull-up resistors are enabled after reset.

1: EBI D[15:0] are not internally pulled up.

## 7.8 Peripheral overview

### 7.8.1 External Bus Interface

- Optimized for Application Memory Space support
- Integrates Three External Memory Controllers:
  - Static Memory Controller
  - SDRAM Controller
  - ECC Controller
- Additional Logic for NAND Flash/SmartMedia™ and CompactFlash™ Support
  - SmartMedia support: 8-bit as well as 16-bit devices are supported
  - CompactFlash support: all modes (Attribute Memory, Common Memory, I/O, True IDE) are supported but the signals \_IOIS16 (I/O and True IDE modes) and \_ATA SEL (True IDE mode) are not handled.
- Optimized External Bus:
  - 16- or 32-bit Data Bus
  - Up to 26-bit Address Bus, Up to 64-Mbytes Addressable
  - Optimized pin multiplexing to reduce latencies on External Memories
- Up to 6 Chip Selects, Configurable Assignment:
  - Static Memory Controller on NCS0
  - SDRAM Controller or Static Memory Controller on NCS1
  - Static Memory Controller on NCS2
  - Static Memory Controller on NCS3, Optional NAND Flash/SmartMedia™ Support
  - Static Memory Controller on NCS4 - NCS5, Optional CompactFlash™ Support

### 7.8.2 Static Memory Controller

- 6 Chip Selects Available
- 64-Mbyte Address Space per Chip Select
- 8-, 16- or 32-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse And Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse And Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- Compliant with LCD Module
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Asynchronous Read in Page Mode Supported: Page Size Ranges from 4 to 32 Bytes

### 7.8.3 SDRAM Controller

- Numerous Configurations Supported
  - 2K, 4K, 8K Row Address Memory Parts
  - SDRAM with Two or Four Internal Banks
  - SDRAM with 16- or 32-bit Data Path
- Programming Facilities
  - Word, Half-word, Byte Access
  - Automatic Page Break When Memory Boundary Has Been Reached
  - Multibank Ping-pong Access
  - Timing Parameters Specified by Software
  - Automatic Refresh Operation, Refresh Rate is Programmable

- Energy-saving Capabilities
  - Self-refresh, Power-down and Deep Power Modes Supported
  - Supports Mobile SDRAM Devices
- Error Detection
  - Refresh Error Interrupt
- SDRAM Power-up Initialization by Software
- CAS Latency of 1, 2, 3 Supported
- Auto Precharge Command Not Used

## 7.8.4 Error Corrected Code Controller

- Hardware Error Corrected Code (ECC) Generation
  - Detection and Correction by Software
- Supports NAND Flash and SmartMedia™ Devices with 8- or 16-bit Data Path.
- Supports NAND Flash/SmartMedia with Page Sizes of 528, 1056, 2112 and 4224 Bytes, Specified by Software

## 7.8.5 Serial Peripheral Interface

- Supports communication with serial external devices
  - Four chip selects with external decoder support allow communication with up to 15 peripherals
  - Serial memories, such as DataFlash™ and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD Controllers, CAN Controllers and Sensors
  - External co-processors
- Master or slave serial peripheral bus interface
  - 8- to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delays between consecutive transfers and between clock and data per chip select
  - Programmable delay between consecutive transfers
  - Selectable mode fault detection
- Very fast transfers supported
  - Transfers with baud rates up to MCK
  - The chip select line may be left active to speed up transfers on the same device

## 7.8.6 Two-wire Interface

- Compatibility with standard two-wire serial memory
- One, two or three bytes for slave address
- Sequential read/write operations

**7.8.7 USART**

- Programmable Baud Rate Generator
- 5- to 9-bit full-duplex synchronous or asynchronous serial communications
  - 1, 1.5 or 2 stop bits in Asynchronous Mode or 1 or 2 stop bits in Synchronous Mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - MSB- or LSB-first
  - Optional break generation and detection
  - By 8 or by-16 over-sampling receiver frequency
  - Hardware handshaking RTS-CTS
  - Receiver time-out and transmitter timeguard
  - Optional Multi-drop Mode with address generation and detection
  - Optional Manchester Encoding
- RS485 with driver control signal
- ISO7816, T = 0 or T = 1 Protocols for interfacing with smart cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA modulation and demodulation
  - Communication at up to 115.2 Kbps
- Test Modes 46
  - Remote Loopback, Local Loopback, Automatic Echo

**7.8.8 Serial Synchronous Controller**

- Provides serial synchronous communication links used in audio and telecom applications (with CODECs in Master or Slave Modes, I2S, TDM Buses, Magnetic Card Reader, etc.)
- Contains an independent receiver and transmitter and a common clock divider
- Offers a configurable frame sync and data length
- Receiver and transmitter can be programmed to start automatically or on detection of different event on the frame sync signal
- Receiver and transmitter include a data signal, a clock signal and a frame synchronization signal

**7.8.9 AC97 Controller**

- Compatible with AC97 Component Specification V2.2
- Capable to Interface with a Single Analog Front end
- Three independent RX Channels and three independent TX Channels
  - One RX and one TX channel dedicated to the AC97 Analog Front end control
  - One RX and one TX channel for data transfers, connected to the DMAC
  - One RX and one TX channel for data transfers, connected to the DMAC
- Time Slot Assigner allowing to assign up to 12 time slots to a channel
- Channels support mono or stereo up to 20 bit sample length - Variable sampling rate AC97 Codec Interface (48KHz and below)

## 7.8.10 Audio DAC

- Digital Stereo DAC
- Oversampled D/A conversion architecture
  - Oversampling ratio fixed 128x
  - FIR equalization filter
  - Digital interpolation filter: Comb4
  - 3rd Order Sigma-Delta D/A converters
- Digital bitstream outputs
- Parallel interface
- Connected to DMA Controller for background transfer without CPU intervention

## 7.8.11 Timer Counter

- Three 16-bit Timer Counter Channels
- Wide range of functions including:
  - Frequency Measurement
  - Event Counting
  - Interval Measurement
  - Pulse Generation
  - Delay Timing
  - Pulse Width Modulation
  - Up/down Capabilities
- Each channel is user-configurable and contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multi-purpose input/output signals
- Two global registers that act on all three TC Channels

## 7.8.12 Pulse Width Modulation Controller

- 4 channels, one 16-bit counter per channel
- Common clock generator, providing Thirteen Different Clocks
  - A Modulo n counter providing eleven clocks
  - Two independent Linear Dividers working on modulo n counter outputs
- Independent channel programming
  - Independent Enable Disable Commands
  - Independent Clock
  - Independent Period and Duty Cycle, with Double Bufferization
  - Programmable selection of the output waveform polarity
  - Programmable center or left aligned output waveform

## 7.8.13 Multimedia Card Interface

- 2 double-channel Multimedia Card Interface, allowing concurrent transfers with 2 cards
- Compatibility with MultiMedia Card Specification Version 2.2
- Compatibility with SD Memory Card Specification Version 1.0
- Compatibility with SDIO Specification Version V1.0.
- Cards clock rate up to Master Clock divided by 2
- Embedded power management to slow down clock rate when not used
- Each MCI has two slot, each supporting
  - One slot for one MultiMediaCard bus (up to 30 cards) or
  - One SD Memory Card
- Support for stream, block and multi-block data read and write

## 7.8.14 PS/2 Keyboard Interface

- Peripheral Bus slave
- PS/2 Host
- Receive and transmit capability
- Parity generation and error detection
- Overrun error detection

## 7.8.15 USB Device Port

- USB V2.0 high-speed compliant, 480 Mbits per second
- Embedded USB V2.0 high-speed transceiver
- Embedded dual-port RAM for endpoints
- Suspend/Resume logic
- Ping-pong mode (two memory banks) for isochronous and bulk endpoints
- Six general-purpose endpoints
  - Endpoint 0, Endpoint 3: 8 bytes, no ping-pong mode
  - Endpoint 1, Endpoint 2: 64 bytes, ping-pong mode
  - Endpoint 4, Endpoint 5: 256 bytes, ping-pong mode

## 7.8.16 LCD Controller

- Single and Dual scan color and monochrome passive STN LCD panels supported
- Single scan active TFT LCD panels supported
- 4-bit single scan, 8-bit single or dual scan, 16-bit dual scan STN interfaces supported
- Up to 24-bit single scan TFT interfaces supported
- Up to 16 gray levels for mono STN and up to 4096 colors for color STN displays
- 1, 2 bits per pixel (palletized), 4 bits per pixel (non-palletized) for mono STN
- 1, 2, 4, 8 bits per pixel (palletized), 16 bits per pixel (non-palletized) for color STN
- 1, 2, 4, 8 bits per pixel (palletized), 16, 24 bits per pixel (non-palletized) for TFT
- Single clock domain architecture
- Resolution supported up to 2048x2048
- 2D-DMA Controller for management of virtual Frame Buffer
  - Allows management of frame buffer larger than the screen size and moving the view over this virtual frame buffer
- Automatic resynchronization of the frame buffer pointer to prevent flickering
- Configurable coefficients with flexible fixed-point representation.

•

### 7.8.17 Image Sensor Interface

- ITU-R BT. 601/656 8-bit mode external interface support
- Support for ITU-R BT.656-4 SAV and EAV synchronization
- Vertical and horizontal resolutions up to 2048 x 2048
- Preview Path up to 640\*480
- Support for packed data formatting for YCbCr 4:2:2 formats
- Preview scaler to generate smaller size image 50
- Programmable frame capture rate

## **8. Boot Sequence**

This chapter summarizes the boot sequence of the AT32AP7002. The behaviour after power-up is controlled by the Power Manager.

### **8.1 Starting of clocks**

After power-up, the device will be held in a reset state by the Power-On Reset circuitry, until the power has stabilized throughout the device. Once the power has stabilized, the device will use the XIN0 pin as clock source. XIN0 can be connected either to an external clock, or a crystal. The OSCEN\_N pin is connected either to VDD or GND to inform the Power Manager on how the XIN0 pin is connected. If XIN0 receives a signal from a crystal, dedicated circuitry in the Power Manager keeps the part in a reset state until the oscillator connected to XIN0 has settled. If XIN0 receives an external clock, no such settling delay is applied.

On system start-up, the PLLs are disabled. All clocks to all modules are running. No clocks have a divided frequency, all parts of the system receive a clock with the same frequency as the XIN0 clock.

### **8.2 Fetching of initial instructions**

After reset has been released, the AVR32AP CPU starts fetching instructions from the reset address, which is 0xA000\_0000. This address lies in the P2 segment, which is non-translated, non-cacheable, and permanently mapped to the physical address range 0x0000\_0000 to 0x2000\_0000. This means that the instruction being fetched from virtual address 0xA000\_0000 is being fetched from physical address 0x0000\_0000. Physical address 0x0000\_0000 is mapped to EBI SRAM CS0. This is the external memory the device boots from.

The code read from the SRAM CS0 memory is free to configure the system to use for example the PLLs, to divide the frequency of the clock routed to some of the peripherals, and to gate the clocks to unused peripherals.

## 9. Ordering Information

**Figure 9-1.** Ordering Information

| <b>Ordering Code</b> | <b>Package</b> | <b>Package Type</b> | <b>Packing</b> | <b>Temperature Operating Range</b> |
|----------------------|----------------|---------------------|----------------|------------------------------------|
| AT32AP7002-CTUR      | CTBGA196       | Green               | Reel           | Industrial (-40°C to 85°C)         |
| AT32AP7002-CTUT      | CTBGA196       | Green               | Tray           | Industrial (-40°C to 85°C)         |

## 10. Errata

### 10.1 Rev. C

**1. SPI FDIV option does not work**

Selecting clock signal using FDIV = 1 does not work as specified.

**Fix/Workaround**

Do not set FDIV = 1.

**2. SPI Chip Select 0 BITS field overrides other Chip Selects**

The BITS field for Chip Select 0 overrides BITS fields for other Chip selects.

**Fix/Workaround**

Update Chip Select 0 BITS field to the relevant settings before transmitting with Chip Selects other than 0.

**3. SPI LASTXFER may be overwritten**

When Peripheral Select (PS) = 0, the LASTXFER-bit in the Transmit Data Register (TDR) should be internally discarded. This fails and may cause problems during DMA transfers. Transmitting data using the PDC when PS=0, the size of the transferred data is 8- or 16-bits. The upper 16 bits of the TDR will be written to a random value. If Chip Select Active After Transfer (CSAAT) = 1, the behavior of the Chip Select will be unpredictable.

**Fix/Workaround**

- Do not use CSAAT = 1 if PS = 0
- Use GPIO to control Chip Select lines
- Select PS=1 and store data for PCS and LASTXFER for each data in transmit buffer.

**4. SPI LASTXFER overrides Chip Select**

The LASTXFER bit overrides Chip Select input when PS = 0 and CSAAT is used.

**Fix/Workaround**

- Do not use the CSAAT
- Use GPIO as Chip Select input
- Select PS = 1. Transfer 32-bit with correct LASTXFER settings.

**5. MMC data write operation with less than 12 bytes is impossible.**

The Data Write operation with a number of bytes less than 12 is impossible

**Fix/Workaround**

The PDC counters must always be equal to 12 bytes for data transfers lower than 12 bytes. The BLKLEN or BCNT field are used to specify the real count number.

**6. MMC SDIO interrupt only works for slot A**

If 1-bit data bus width and on other slots than slot A, the SDIO interrupt can not be captured.

**Fix/Workaround**

Use slot A.

**7. PSIF TXEN/RXEN may disable the transmitter/receiver**

Writing a '0' to RXEN will disable the receiver. Writing '0' to TXEN will disable the transmitter.

**Fix/Workaround**

When accessing the PS/2 Control Register always write '1' to RXEN to keep the receiver enabled, and write '1' to TXEN to keep the transmitter enabled.

**8. PSIF TXRDY interrupt corrupts transfers**

When writing to the Transmit Holding Register (THR), the data will be transferred to the data shift register immediately, regardless of the state of the data shift register. If a transfer is ongoing, it will be interrupted and a new transfer will be started with the new data written to THR.

**Fix/Workaround**

Use the TXEMPTY-interrupt instead of the TXRDY-interrupt to update the THR. This ensures that a transfer is completed.

**9. LCD memory error interrupt does not work**

Writing to the MERIT-bit in the LCD Interrupt Test Register (ITR) does not cause an interrupt as intended. The MERIC-bit in the LCD Interrupt Clear Register (ICR) cannot be written. This means that if the MERIS-bit in ISR is set, it cannot be cleared.

**Fix/Workaround**

Memory error interrupt should not be used.

**10. PWN counter restarts at 0x0001**

The PWN counter restarts at 0x0001 and not 0x0000 as specified. Because of this the first PWM period has one more clock cycle.

**Fix/Workaround**

- The first period is 0x0000, 0x0001, ..., period
- Consecutive periods are 0x0001, 0x0002, ..., period

**11. PWM channel interrupt enabling triggers an interrupt**

When enabling a PWM channel that is configured with center aligned period (CALG=1), an interrupt is signalled.

**Fix/Workaround**

When using center aligned mode, enable the channel and read the status before channel interrupt is enabled.

**12. PWM update period to a 0 value does not work**

It is impossible to update a period equal to 0 by the using the PWM update register (PWM\_CUPD).

**Fix/Workaround**

Do not update the PWM\_CUPD register with a value equal to 0.

**13. PWM channel status may be wrong if disabled before a period has elapsed**

Before a PWM period has elapsed, the read channel status may be wrong. The CHIDx-bit for a PWM channel in the PWM Enable Register will read '1' for one full PWM period even if the channel was disabled before the period elapsed. It will then read '0' as expected.

**Fix/Workaround**

Reading the PWM channel status of a disabled channel is only correct after a PWM period

**14. TWI transfer error without ACK**

If the TWI does not receive an ACK from a slave during the address+R/W phase, no bits in the status register will be set to indicate this. Hence, the transfer will never complete.

**Fix/Workaround**

To prevent errors due to missing ACK, the software should use a timeout mechanism to terminate the transfer if this happens.

**10.2 Rev. B**

Not sampled.

**10.3 Rev. A**

Not sampled.

## Atmel Corporation

2325 Orchard Parkway  
San Jose, CA 95131, USA  
Tel: 1(408) 441-0311  
Fax: 1(408) 487-2600

## Regional Headquarters

### Europe

Atmel Sarl  
Route des Arsenalux 41  
Case Postale 80  
CH-1705 Fribourg  
Switzerland  
Tel: (41) 26-426-5555  
Fax: (41) 26-426-5500

### Asia

Room 1219  
Chinachem Golden Plaza  
77 Mody Road Tsimshatsui  
East Kowloon  
Hong Kong  
Tel: (852) 2721-9778  
Fax: (852) 2722-1369

### Japan

9F, Tonetsu Shinkawa Bldg.  
1-24-8 Shinkawa  
Chuo-ku, Tokyo 104-0033  
Japan  
Tel: (81) 3-3523-3551  
Fax: (81) 3-3523-7581

## Atmel Operations

### Memory

2325 Orchard Parkway  
San Jose, CA 95131, USA  
Tel: 1(408) 441-0311  
Fax: 1(408) 436-4314

### Microcontrollers

2325 Orchard Parkway  
San Jose, CA 95131, USA  
Tel: 1(408) 441-0311  
Fax: 1(408) 436-4314

La Chantrerie  
BP 70602  
44306 Nantes Cedex 3, France  
Tel: (33) 2-40-18-18-18  
Fax: (33) 2-40-18-19-60

### ASIC/ASSP/Smart Cards

Zone Industrielle  
13106 Rousset Cedex, France  
Tel: (33) 4-42-53-60-00  
Fax: (33) 4-42-53-60-01

1150 East Cheyenne Mtn. Blvd.  
Colorado Springs, CO 80906, USA  
Tel: 1(719) 576-3300  
Fax: 1(719) 540-1759

Scottish Enterprise Technology Park  
Maxwell Building  
East Kilbride G75 0QR, Scotland  
Tel: (44) 1355-803-000  
Fax: (44) 1355-242-743
