COMPLEMENTARY OUTPUT HALL EFFECT LATCH

❖ GENERAL DESCRIPTION

AX8401 is a single-digital-output Hall-Effect latch sensor for high temperature operation. The device includes an on-chip Hall voltage generator for magnetic sensing, an amplifier to amplify Hall voltage, a comparator to provide switching hysteresis for noise rejection, and an output driver. An internal bandgap regulator provides a temperature compensated supply voltage for internal circuits and allows a wide operating supply range.

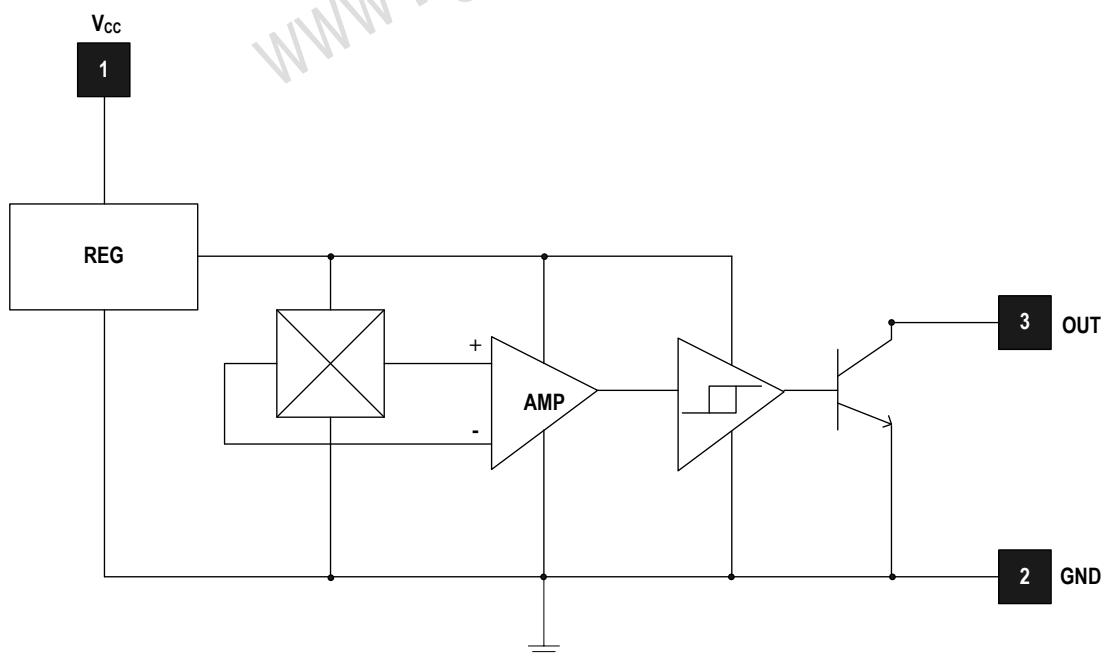

When the magnetic flux density (B) is larger than operate point (B_{op}), output is switched on (OUT pin is pulled low). The output state is held on until a magnetic flux density reversal falls below B_{rp} . When B is less than B_{rp} , the output is switched off.

The AX8401 is available in SIP-3L package.
