## ECL/PECL Differential Receiver

### FEATURES

- Silicon-Germanium for High Speed Operation
- 150ps Typical Propagation Delay
- Internal Input Pulldown Resistors
- Functionally Equivalent to ON Semi MC10EP16 & MC100EP16

### DESCRIPTION

The AZ10/100EP16 is a Silicon-Germanium (SiGe) differential receiver. The device is functionally equivalent to the AZ10/100EL16 device with higher performance capabilities. With output transition times significantly faster than the AZ10/100EL16, the EP16 is ideally suited for interfacing with high frequency sources.

The EP16 provides a  $V_{BB}$  output for single-ended use or a DC bias reference for AC coupling to the device. For single-ended input applications, the  $V_{BB}$  reference should be connected to one side of the D/D differential input pair. The input signal is then fed to the other D/D input. The  $V_{BB}$  pin can support 1.5mA sink/source current. When used, the  $V_{BB}$  pin should be bypassed to ground via a 0.01 $\mu$ F capacitor.

Under open input conditions internal input clamps will force the Q output LOW.

NOTE: Specifications in ECL/PECL tables are valid when thermal equilibrium is established.

### PIN DESCRIPTION

PIN	FUNCTION
D, D	Data Inputs
Q, Q	Data Outputs
$V_{BB}$	Reference Voltage Output
$V_{CC}$	Positive Supply
$V_{EE}$	Negative Supply
NC	No Connect

- Duty cycle skew is the difference between a  $t_{\text{PLH}}$  and  $t_{\text{PHL}}$  propagation delay through a device.
- $V_{\text{PP}}$  is the minimum peak-to-peak differential input swing for which AC parameters are guaranteed.
- The  $V_{\text{CMR}}$  range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{\text{PP}}(\text{min})$  and 1V.
- See Graph Below.
