PIN FUNCTION DESCRIPTION

Pin Number	Mnemonic	Function
1	RO	Receiver Output: When REB is low and if $(A - B) \geq -50\text{mV}$, RO is high; if $(A - B) \leq -200\text{mV}$, RO is low.
2	REB	Receiver Output Enable: REB is low to enable the Receiver; REB is high to disable the Receiver.
3	DE	Transmitter Output Enable: DE is high to enable the transmitter; DE is low to disable the transceiver.
4	DI	Transmitter Input: When DE is high, a low on DI forces A output low and B output high. Similarly, a high on DI forces A output high and B output low.
5	GND	Ground.
6	A	Non-inverting Receiver Input and Non-inverting Transmitter Output.
7	B	Inverting Receiver Input and Inverting Transmitter Output.
8	VCC	Power Supply Input 3.3V.

FUNCTION TABLE

TRANSMITTING				
INPUTS			OUTPUTS	
REB	DE	DI	A	B
X	1	0	0	1
X	1	1	1	0
0	0	X	High- Z	High- Z
1	0	X	Shutdown	

X= Don't care
HIGH- Z= High impedance

RECEIVING			
INPUTS			OUTPUTS
REB	DE	A – B	RO
0	X	$\geq -0.05\text{V}$	1
0	X	$\leq -0.2\text{V}$	0
0	X	Open/Shorted	1
1	1	X	High- Z
1	0	X	Shutdown

X= Don't care
HIGH- Z= High impedance

Detail Description

The AZRS3078 is a half-duplex RS-485 transceiver IC with IEC61000-4-2 contact $\pm 15\text{kV}$ ESD protection for bus pins (A and B), which contains one transmitter and one receiver inside with 3.3V power supply. This device is fully compliant with the EIA/TIA-485 standard.

The AZRS3078 features the hot-swap glitch free design which guarantees the outputs of the transceiver in a high impedance state during the power-up period until the supply voltage has stabilized.

The AZRS3078 with whole chip ESD protected design for all of the I/O pins has robust ESD protection up to both HBM $\pm 8\text{kV}$ and MM $\pm 800\text{V}$. Moreover, the latchup immunity of the AZRS3078 is up to $\pm 400\text{mA}$ for all of the pins. For IC self discharge issue, the CDM protection level of the AZRS3078 is up to $\pm 1\text{kV}$.

Transmitter

The design of the transmitter is a non-inverted translator that converts the single-ended TTL input signal to differential EIA/TIA-485 signal level. The transmitter of the AZRS3078 guarantees 16Mbps data rate communication. When the transmitter is active (DE= HIGH), the single-end TTL input signals of transmitter will be transported to differential output RS485 signals of the transmitter. Under the disable state (DE= LOW), the outputs of transmitter keep at high impedance state. The differential output voltage (VA-VB) of the AZRS3078 is at least 1.5V with 54 ohm load under $T = 25^\circ\text{C}$.

Receiver

The receiver of the AZRS3078 converts the differential EIA/TIA-485 signals to single-end output TTL signal when receiver is in active state (REB=LOW). When the receiver is disable (REB=HIGH), the output of the receiver keeps in high impedance state no matter what receiver input.

True Fail-Safe

In traditional design, the fail-safe function is implemented by resistors on the PCB. One resistor is terminated pin A to VCC; the other is terminated pin B to GND to keep RO at high state when bus is idle, which is only the open fail-safe. The AZRS3078 guarantees a receiver output high when the receiver inputs are short, open or idle, that is true fail-safe. The threshold voltage of receiver input is between -50mV and -200mV . If the differential input voltage (A - B) of receiver is greater than or equal to -50mV , receiver output (RO) is logic-high. If (A - B) is less than or equal to -200mV , RO is logic-low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage (A - B) is 0V, so the RO is logic-high at that time.

1/8 Unit Load

The RS-485 standard defines both receiver inputs impedance are $12\text{k}\Omega$ (1 unit load) and the maximum 32-unit loads on the bus. The AZRS3078 transceiver has a $96\text{k}\Omega$ input impedance (1/8 unit load) of the receiver, allowing up to 256 or fewer devices to be connected in parallel on the RS485 bus.

Transmitter Output Protection

The AZRS3078 has the current limitation function and the thermal shutdown protection in the transmitter. Firstly, the function of current limitation provides immediate protection against short circuits over the whole common-mode voltage range (-7V to $+12\text{V}$). Secondly, the function of thermal shutdown protection forces the transmitter outputs into a high impedance state if the die temperature becomes excessive.
