6. Detailed Description

6.1 Function Description

The B26LV32TERH can detect signals as low as $\pm 200\text{mV}$ over the common mode range of -7V to $+7\text{V}$. The receivers are also equipped with input fail safe circuitry, which causes the outputs to go to a logic “1” when the inputs are open. Enable and Disable functions are common to all four receivers. truth table is shown in table 6-1.

Table 6-1 truth table

ENABLE	\overline{ENABLE}	Input	Output
L	H	X	Z
All other combinations of ENABLE inputs		$V_{ID} \geq V_{Th}(\text{Max})$	H
		$V_{ID} \leq V_{Th}(\text{Min})$	L
		Open	H

L = Low logic state

X = Irrelevant

H = High logic state

Z = TRI-STATE (high impedance)

9. Appendix I Typical Application Example

The B26LV32TERH receiver's intended use is primarily in an uncomplicated point-to-point configuration as is shown in Appendix figure 1-1. This configuration provides a clean signaling environment for quick edge rates of the drivers. The receiver is connected to the driver through a balanced media such as a standard twisted pair cable. Typically, the characteristic impedance of the media is in the range of 100Ω. A termination resistor of 100Ω should be selected to match the media and is located as close to the receiver input pins as possible. Other configurations are possible such as a multireceiver configuration, Multidrop configuration as is shown in Appendix figure 1-2.
