

DC Brushless Motor Drivers for Cooling Fans

Two-phase Full-wave DC Brushless Fan Motor Drivers

BD6701F, BA6406F, BA6506F, BA6901F, BD6712AF

No.12010EAT03

●Description

This is the summary of models for two-phase half-wave fan motor driver. They incorporate lock protection, automatic restart circuit and FG/AL output. Some of them have variable speed control function, 48V power supply adaptation.

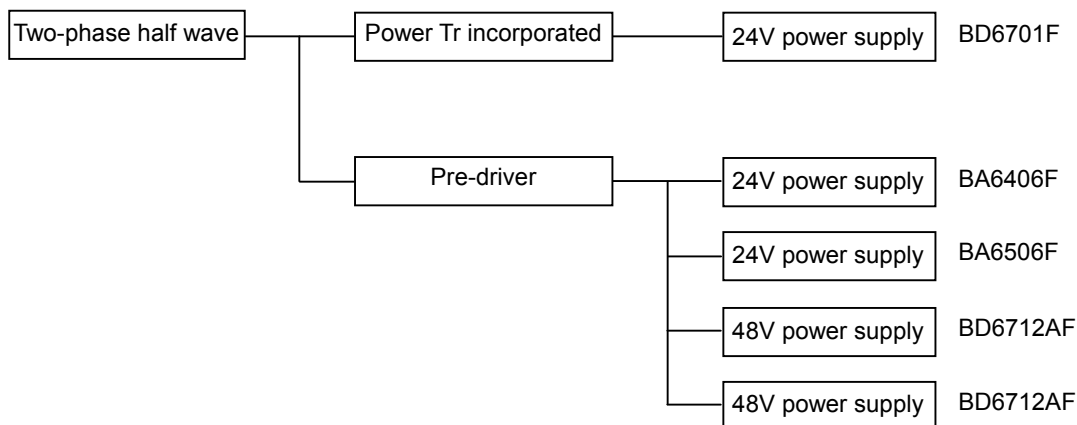

●Feature

- 1) Power Tr incorporated(BD6701F)
- 2) Pre-driver(BA6406F、BA6901F、BD6712AF、BA6506F)
- 3) Variable speed control(BA6901F)
- 4) Incorporates reverse connection protection diode(BD6701F)
- 5) Incorporates lock protection and automatic restart circuit
- 6) Rotation speed pulse signal (FG) output(BD6701F、BA6901F、BD6712AF、BA6506F)
- 7) Lock alarm signal (AL) output(BD6701F、BA6901F、BD6712AF、BA6406F)

●Applications

For desktop PC, server, general consumer equipment, communication equipment and industrial equipment.

●Lineup

● Absolute maximum ratings

◎BD6701FV

Parameter	Symbol	Limit	Unit
Supply voltage	Vcc	36	V
Power dissipation	Pd	780*	mW
Operating temperature range	Topr	-40~+100	°C
Storage temperature range	Tstg	-55~+150	°C
Output current	Iomax	800**	mA
AL signal output current	I _{AL}	10	mA
AL signal output voltage	V _{AL}	36	V
FG signal output current	I _{FG}	10	mA
FG signal output voltage	V _{FG}	36	V
Junction temperature	T _{jmax}	150	°C

* Reduce by 6.24 mW/°C over 25°C. (On 70.0 mm x 70.0 mm x 1.6 mm glass epoxy board)

** This value is not to exceed Pd.

◎BA6406F

Parameter	Symbol	Limit	Unit
Supply voltage	Vcc	30	V
Power dissipation	Pd	624*	mW
Operating temperature	Topr	-40~+100	°C
Storage temperature	Tstg	-55~+125	°C
Output current	Iomax	70	mA
AL signal output current	I _{AL}	8	mA
AL signal output voltage	V _{AL}	30	V
Junction temperature	T _{jmax}	125	°C

* Reduce by 6.24 mW/°C over 25°C. (On 70.0 mm x 70.0 mm x 1.6 mm glass epoxy board)

◎BA6506F

Parameter	Symbol	Limit	Unit

1) Lock protection and automatic restart

○Incorporated counter system <BD6701F、BD6712AF>

Motor rotation is detected by hall signal, and lock detection ON time (TON) and lock detection OFF time (TOFF) are set by IC internal counter. Timing chart is shown in Fig.40.

Fig.40 Lock protection (incorporated counter system) timing chart

OCR timer system <BA6406F, BA6506F, BA6901F>

Charging and discharging time at LD terminal depends on the capacitor equipped externally on LD terminal. Charging and discharging time is determined as follows:

$$TON(\text{charging time}) = \frac{C \times (VLDCP - VLDC)}{ILDC}$$

$$TOFF(\text{discharging time}) = \frac{C \times (VLDC - VLDCP)}{ILDD}$$

- C : Capacity of capacitor equipped externally on LD terminal
- VLDC : LD terminal clamping voltage
- VLDCP : LD terminal comparator voltage
- ILDC : LD terminal charging current
- ILDD : LD terminal discharging current

For reference, charging and discharging time when C = 1.0 μ F can be calculated as follows(BA6901F);

Charging time=0.36sec(output ON)

Discharging time=3.6sec(output OFF)

Timing chart of LD terminal is shown in Fig.41.

Fig.41 Lock protection (CR timer system) timing chart

When the motor is locked with hall input terminal (H-) in Lo status, FG logic is reversed. AL might be high for few hundred ms in turning on. (BA6406F)

3) PWM terminal <BA6901F>

The signal input to PWM terminal is below L (0.8V or less), output (A1 and A2) turns off. And when it is above H (2.0V or more), output turns on. PWM terminal is pulled up by resistor (30kΩ:typ.) inside IC. When it is open, the output is in operating mode.

Fig.42 Timing chart in PWM control

4) Charging and discharging pulse circuit compatible with temperature variable speed control <BA6901F>

When an external capacitor and resistor are connected to CR terminal, saw wave is generated by charging and discharging of capacitor corresponding to the cycle of hall signal. Saw wave of CR terminal changes with the external capacitor and resistor. Waveform of CR terminal is output to TOUT by buffer amplifier.

CR terminal is variable from VCRCP (0.35V:typ., see the electric characteristics) to Vcc. When CR voltage is above Vcc-VTOH (1V:typ., see the electric characteristics), CR terminal signal is not output to TOUT terminal as shown in Fig.43.

Fig.43 CR terminal and TOUT terminal timing chart

5) Variable speed control application <BA6901F>

This is an example of the application which makes the fan motor rotating speed variable corresponding to ambient temperature with thermistor by use of charging and discharging pulse circuit and PWM input.

Fig. 44 Example of temperature variable speed application

Fig. 45 Temperature variable speed timing chart

When the temperature becomes the lower and the thermistor terminal voltage the higher, PWM pulse becomes the shorter and speed is reduced as shown in Fig. 45.

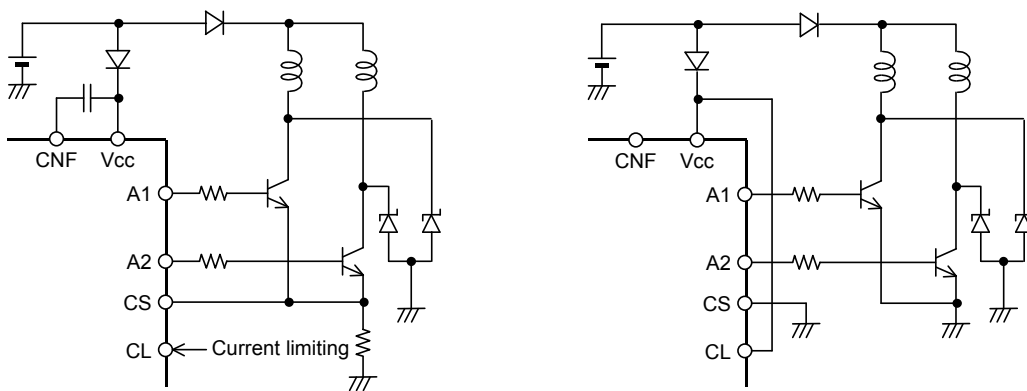

6) Current limiting circuit <BA6901F>

Output current limitation can be set by the voltage (VCL) input to CL terminal. Connect a resistor (RNF) for detecting output current between the emitter of external output transistor and GND, and input the voltage generated by resistor to CS terminal, thereby detecting the output current. The output current is limited so that CL terminal and CS terminal has the same potential. There is an offset between CL terminal and CS terminal. Current limiting value can be calculated by the formula below:

$$\text{Current limiting value} = \frac{VCL - V_{ofsCS}}{RNF}$$

$V_{ofsCS} = \text{CL-CS offset}$

When limiting the output current, capacitor for phase compensation must be connected between CNF terminal and Vcc terminal. When the output current is not to be limited, fix CL terminal voltage to High level (Vcc) and CS terminal to Low level (GND).

(a) When current limiting is applied

(b) When current limiting is not applied

Fig.46 External circuit of output

7) Power supply voltage clamping circuit <BD6712AF>

When the external supply voltage exceeds supply clamping voltage Vcz (see the electric characteristics), supply clamping turns on. Adjust the capacity of bypass capacitor (C2) so that the transient peak voltage does not exceed the maximum of supply clamping voltage at IC power supply terminal (Vcc).

When you use the external supply voltage above supply clamping voltage, insert the limiting resistor (R1) between the external supply and IC supply terminal. Set the limiting resistor (R1) so that Icc does not exceed the operation power supply amperage.

Example of calculation for BD6712AF is shown below:

- External supply voltage : VS
 - Supply current limiting resistor : R1
 - Circuit current : Icc
 - Supply terminal voltage : Vcc
 - Supply clamping voltage : Vcz=6V(typ.)
 - Hall current limiting resistor : R2
 - Hall element current : IH
 - Hall element resistance : RH
- Then,

$$R1 = \frac{VS - Vcc}{Icc + IH} \dots \textcircled{1}$$

Fig.47 Example of supply voltage clamping application circuit

Assuming R2 = 2kΩ and RH = 0.5kΩ, IH is calculated as follows:

$$IH = \frac{Vcc}{R2 + RH} \dots \textcircled{2}$$

$$= 6V / (2k\Omega + 0.5k\Omega)$$

$$= 2.4mA$$

Icc has minimum 4mA and maximum 30mA, therefore the minimum and maximum value of R1 is calculated as follows by the formula ①:

VS	R1 Min. value	R1 Max. value
5V	0Ω	0kΩ
24V	550Ω	2.8kΩ
48V	1.3kΩ	6.6kΩ

8) Hall input setting

Hall input voltage range is shown in operating conditions.

Fig.48 Hall input voltage range

Adjust the hall element bias resistor R1 and R2 in Fig.49 so that the input voltage at hall amplifier is input in "hall input voltage range" including the amplitude of signal.

For a model having hall input voltage range lower limit 0V, R2 = 0Ω is acceptable.

○Reduction of noise of hall signal

Hall element may be affected by Vcc noise or the like depending on the wiring pattern of board. In this case, place a capacitor like C1 in Fig.49. In addition, when wiring from the hall element output to IC hall input is long, noise may be loaded on wiring. In this case, place a capacitor like C2 in Fig.49.

$$\text{Hall bias current} = V_{cc} / (R1 + R2 + R_H)$$

Fig.49 Application near of hall signal

4) Power supply terminal

● Safety measure

1) Reverse connection protection diode

Reverse connection of power results in IC destruction as shown in Fig 50. When reverse connection is possible, reverse connection protection diode must be added between power supply and Vcc.

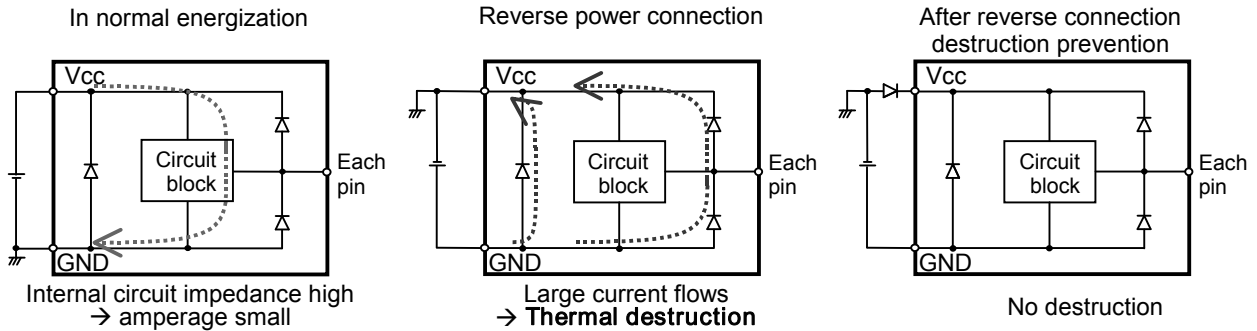

Fig.50 Current flow when power is connected reversely

* As for BD6701F, this diode is built-in in the IC, so a protection diode between power supply -Vcc terminal is unnecessary.

2) About measures of voltage rise by back electromotive force

The voltage of output terminal rises by back electromotive force. The diode D1 of Fig.51 is necessary to divide a power supply line of motor with small signal line, so that the voltage of the output does not affect a power supply line.

Fig.51 Separation of a power supply line

The models that incorporate power Tr (BD6701F) have the circuit, which clamps the output voltage so that back electromotive force does not exceed the maximum rating voltage of output Tr.

3) FG, AL output

Fig.52 Protection of FG and AL terminal

FG and AL output is an open collector and requires pull-up resistor.

The IC can be protected by adding resistor R1. An excess of absolute maximum rating, when FG or AL output terminal is directly connected to power supply, could damage the IC.

4) Problem of GND line PWM switching

Do not perform PWM switching of GND line because GND terminal potential cannot be kept to a minimum.

Fig.53 GND Line PWM switching prohibited

● Calculation of power consumption by IC

Power consumption of this IC is approximately calculated as follows:

$$P_c = P_{c1} + P_{c2} + P_{c3}$$

- P_{c1} : Power consumption by circuit current

$$P_{c1} = V_{cc} \times I_{cc}$$

- P_{c2} : Power consumption on output stage

$$P_{c2} = V_{OL} \times I_o$$

V_{OL} is the L voltage of output terminal 1 and 2.

I_o is the current flowing to output terminal 1 and 2.

- P_{c3} : Power consumption at FG and AL

$$P_{c3} = V_{FG} \times I_{FG} + V_{AL} \times I_{AL}$$

V_{FG} is L voltage of FG output.

V_{AL} is L voltage of AL output.

I_{FG} and I_{AL} are the current of FG and AL.

Fig.54 Calculation of power consumption by IC

Power consumption by IC greatly changes with use condition of IC such as power supply voltage and output current. Consider thermal design so that the maximum power dissipation on IC package is not exceeded.

● Thermal derating curve

Power dissipation (total loss) indicates the power that can be consumed by IC at Ta = 25°C (normal temperature). IC is heated when it consumes power, and the temperature of IC chip becomes higher than ambient temperature. The temperature that can be accepted by IC chip depends on circuit configuration, manufacturing process, etc, and consumable power is limited. Power dissipation is determined by the temperature allowed in IC chip (maximum junction temperature) and thermal resistance of package (heat dissipation capability). The maximum junction temperature is in general equal to the maximum value in the storage temperature range.

Heat generated by consumed power of IC is radiated from the mold resin or lead frame of package. The parameter which indicates this heat dissipation capability (hardness of heat release) is called heat resistance, represented by the symbol θ_{ja} [°C/W]. The temperature of IC inside the package can be estimated by this heat resistance. Fig.55 shows the model of heat resistance of the package.

Heat resistance θ_{ja} , ambient temperature Ta, junction temperature Tj, and power consumption P can be calculated by the equation below:

$$\theta_{ja} = (T_j - T_a) / P \quad [^{\circ}\text{C}/\text{W}]$$

Thermal derating curve indicates power that can be consumed by IC with reference to ambient temperature. Power that can be consumed by IC begins to attenuate at certain ambient temperature. This gradient is determined by thermal resistance θ_{ja} .

Thermal resistance θ_{ja} depends on chip size, power consumption, package ambient temperature, packaging condition, wind velocity, etc., even when the same package is used. Thermal derating curve indicates a reference value measured at a specified condition. Fig.56 shows a thermal derating curve (Value when mounting FR4 glass epoxy board 70 [mm] x 70 [mm] x 1.6 [mm] (copper foil area below 3 [%]))

Fig.55 Thermal resistance

* Reduce by 6.24 mW/°C over 25°C. <BD6701F, BA6406F, BD6712AF >
 Reduce by 5.0 mW/°C over 25°C. <BA6901F >
 (70.0mm x 70.0mm x 1.6mm glass epoxy board)

●Cautions on use

- 1) Absolute maximum ratings
An excess in the absolute maximum ratings, such as supply voltage, temperature range of operating conditions, etc., can break down the devices, thus making impossible to identify breaking mode, such as a short circuit or an open circuit. If any over rated values will expect to exceed the absolute maximum ratings, consider adding circuit protection devices, such as fuses.
- 2) Connecting the power supply connector backward
Connecting of the power supply in reverse polarity can damage IC. Take precautions when connecting the power supply lines. An external direction diode can be added.
- 3) Power supply line
Back electromotive force causes regenerated current to power supply line, therefore take a measure such as placing a capacitor between power supply and GND for routing regenerated current. And fully ensure that the capacitor characteristics have no problem before determine a capacitor value. (when applying electrolytic capacitors, capacitance characteristic values are reduced at low temperatures)
- 4) GND potential
The potential of GND pin must be minimum potential in all operating conditions. Also ensure that all terminals except GND terminal do not fall below GND voltage including transient characteristics. However, it is possible that the motor output terminal may deflect below GND because of influence by back electromotive force of motor. Malfunction may possibly occur depending on use condition, environment, and property of individual motor. Please make fully confirmation that no problem is found on operation of IC.
- 5) Thermal design
Use a thermal design that allows for a sufficient margin in light of the power dissipation(Pd) in actual operating conditions.
- 6) Inter-pin shorts and mounting errors
Use caution when positioning the IC for mounting on printed circuit boards. The IC may be damaged if there is any connection error or if pins are shorted together.
- 7) Actions in strong electromagnetic field
Use caution when using the IC in the presence of a strong electromagnetic field as doing so may cause the IC to malfunction.
- 8) ASO
When using the IC, set the output transistor so that it does not exceed absolute maximum ratings or ASO.
- 9) Thermal shut down circuit(* 1)
The IC incorporates a built-in thermal shutdown circuit (TSD circuit). Operation temperature is 175°C(typ.) and has a hysteresis width of 25°C(typ.). When IC chip temperature rises and TSD circuit works, the output terminal becomes an open state. TSD circuit is designed only to shut the IC off to prevent thermal runaway. It is not designed to protect the IC or guarantee its operation. Do not continue to use the IC after operation this circuit or use the IC in an environment where the operation of this circuit is assumed. (* 1:BA6406F does not incorporate TSD circuit.)
- 10) Testing on application boards
When testing the IC on an application board, connecting a capacitor to a pin with low impedance subjects the IC to stress. Always discharge capacitors after each process or step. Always turn the IC's power supply off before connecting it to or removing it from a jig or fixture during the inspection process. Ground the IC during assembly steps as an antistatic measure. Use similar precaution when transporting or storing the IC.
- 11) GND wiring pattern
When using both small signal and large current GND patterns, it is recommended to isolate the two ground patterns, placing a single ground point at the ground potential of application so that the pattern wiring resistance and voltage variations caused by large currents do not cause variations in the small signal ground voltage. Be careful not to change the GND wiring pattern of any external components, either.
- 12) Capacitor between output and GND
When a large capacitor is connected between output and GND, if Vcc is shorted with 0V or GND for some cause, it is possible that the current charged in the capacitor may flow into the output resulting in destruction. Keep the capacitor between output and GND below 100uF.
- 13) IC terminal input
When Vcc voltage is not applied to IC, do not apply voltage to each input terminal. When voltage above Vcc or below GND is applied to the input terminal, parasitic element is actuated due to the structure of IC. Operation of parasitic element causes mutual interference between circuits, resulting in malfunction as well as destruction in the last. Do not use in a manner where parasitic element is actuated.
- 14) In use
We are sure that the example of application circuit is preferable, but please check the character further more in application to a part which requires high precision. In using the unit with external circuit constant changed, consider the variation of externally equipped parts and our IC including not only static character but also transient character and allow sufficient margin in determining.

Notes

No copying or reproduction of this document, in part or in whole, is permitted without the consent of ROHM Co.,Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Thank you for your accessing to ROHM product informations.
