1 Product Brief

The BFP843 is a low noise broadband NPN bipolar RF transistor. Its integrated feedback provides a broadband pre-match to $50\ \Omega$ at input and output and improves the stability against parasitic oscillations. These measures simplify the design of arbitrary LNA application circuits. The device is based on Infineon's reliable high volume silicon germanium carbon (SiGe:C) heterojunction bipolar technology. The collector design supports voltages up to $V_{CE0} = 2.25\ \text{V}$ and currents up to $I_C = 55\ \text{mA}$. The device is especially suited for mobile applications in which low power consumption is a key requirement. The transistor is fitted with internal protection circuits, which enhance the robustness against electrostatic discharge (ESD) and against high levels of RF input power. The device is housed in an easy to use plastic package with visible leads.

You find the BFP843 SPICE GP model in the internet in MWO- and ADS-format, which you can import into these circuit simulation tools very quickly and conveniently. The model already contains the package parasitics and is ready to use for DC and high frequency simulations. The terminals of the model circuit correspond to the pin configuration of the device.

The model parameters have been extracted and verified up to 12 GHz using typical devices. The BFP843 SPICE GP model reflects the typical DC- and RF-performance within the limitations which are given by the SPICE GP model itself. Besides the DC characteristics all S-parameters in magnitude and phase, as well as noise figure (including optimum source impedance, equivalent noise resistance and flicker noise) and intermodulation have been extracted.
