Middle Power Class-D Speaker Amplifier series

# 17W+17W
# Full Digital Speaker Amplifier
# with built-in DSP

### BM28723MUV

## General Description

BM28723MUV is a 17W+17W Class D stereo Speaker Amplifier with built-in DSP designed for TVs specifically for space-saving and low-power consumption.

BM28723MUV features BCD (Bipolar, CMOS, DMOS) process technology to achieve high efficiency. In addition, BM28723MUV is packaged in a compact back surface heatsink type power package to attain low power consumption, low heat generation without external heatsink. The package Max output power is only 17W+17W (When $R_L$=8Ω) as compared to 20W+20W (When $R_L$=8Ω) Max output power of package with external heat-sink.

The product satisfies all needs for drastic downsizing, low-profile structures and powerful high quality playback of sound systems.

## Key Specifications

- Supply voltage range          10V to 24V
  ($V_{CCP1}$,$V_{CCP2}$)
- Speaker output power          17W+17W (Typ)
  ($V_{CCP1}$,$V_{CCP2}$=18V,
  $R_L$=8Ω)
- THD+N          0.08 [%] (Typ)

## Applications

- TVs (LCD, OLED)
- Home Audio
- Desktop PC
- Amusement equipment
- Electronic Music equipment, etc.

## Features

- Built-in DSP (Digital Sound Processor) for Audio Signal Processing for TVs
  12-Band/ch BQ, 3-Band DRC, Pre-Scaler, Channel Mixer, Fine Master Volume, Hard Clipper, Level Meter, etc.
- Single Input System for Digital Audio Interface (No Master Clock Required)
  - $I^2$S / LJ / RJ Format
  - LRCLK: 32 / 44.1 / 48kHz
  - BCLK: 32 / 48 / 64$f_S$
  - SDATA: 16 / 20 / 24 bit
- Single Output System for Digital Audio Interface
  - $I^2$S Format
  - SDATA: 16 / 20 / 24 bit
- No Snubber Circuit Required ($V_{CCP1}$,$V_{CCP2}$≤22V) because of Slew Rate Control
- Output Feedback Circuit which prevents decrease of sound quality caused by change of power supply voltage, achieves low noise and low distortion, So no large electrolytic-capacitors for Vcc bypass is required.
- Wide Range of Power Supply Input Voltage
- The monaural output reduces the number of external parts needed.
- High Efficiency and Low Heat Dissipation allowing Miniaturization, Slim Design, and also Power Saving of the System
- Eliminates pop-noise generated during the power supply ON/OFF. High quality muting performance is achieved using the soft-muting technology.
- Built-in with Various Protection Functions for Highly Reliability Design
  - High Temperature Protection
  - Under Voltage Protection
  - Output Short Protection
  - DC Voltage Protection for speaker
  - Clock Stop Protection
- Small Package, It reduces surface mount area

**Package**          W(Typ) x D(Typ) x H(Max)
VQFN032V5050          5.00mm x 5.00mm x 1.00mm

## Typical Application Circuit

Figure 1. Typical application circuit

VQFN032V5050

○Product structure : Silicon monolithic integrated circuit   ○This product has not designed protection against radioactive rays

| 19 | BSP2P | – | Boot strap pin, CH2 positive<br><br>Connect a capacitor from pin to OUT2P. | |
| 20 | OUT2P | V$_{CCP2}$ to 0V | PWM output pin, CH2 positive<br><br>Connect pin to output LPF.<br>(Note) If this pin is shorted to GND, the IC may break.<br>(Note) When Reset ON or Mute ON, all output transistors are OFF and output terminals are pulled down by 10kΩ (Typ). | |

The numerical value of I/O equivalence circuit is typical value, not guaranteed.

## I/O equivalence circuit(s) - continued

| Pin No. | Pin name | Pin voltage | Pin explanation | I/O equivalence circuit |
|---|---|---|---|---|
| 21 | OUT1N | $V_{CCP1}$ to 0V | PWM output pin, CH1 negative<br><br>Connect pin to output LPF.<br>(Note) If this pin is shorted to GND, the IC may break.<br>(Note) When Reset ON or Mute ON, all output transistors are OFF and output terminals are pulled down by 10kΩ (Typ). |  |
| 22 | BSP1N | — | Boot strap pin, CH1 negative<br><br>Connect a capacitor from pin to OUT1N. | |
| 23 | GNDP1 | 0V | Power GND pin for ch1 | |
| 24 | VCCP1 | $V_{CCP1}$ | Power supply pin for ch1 | |
| 25 | OUT1P | $V_{CCP1}$ to 0V | PWM output pin, CH1 positive<br><br>Connect to output LPF.<br>(Note) If this pin is shorted to GND, the IC may break.<br>(Note) When Reset ON or Mute ON, all output transistors are OFF and output terminals are pulled down by 10kΩ (Typ). | |
| 26 | BSP1P | — | Boot-strap pin of ch1 positive<br><br>Connect a capacitor from pin to OUT1P. | |
| 27 | REG_G | 5.7V | Internal power supply pin for gate driver<br><br>Connect capacitor<br><br>(Note) The REG_G terminal of BM28723MUV should not be used as an external supply and cannot support voltage load from external source. Therefore, do not connect anything except capacitor for stabilization. |  |
| 29 | RSTX | 0V | Reset pin for Digital circuit<br>High: Reset OFF<br>Low: Reset ON<br><br>Select pull-down resistor after DVDD is applied. |  |
| 30 | MUTEX | 0V | Speaker output mute control pin<br>High: Mute OFF<br>Low: Mute ON<br><br>Select pull-down resistor after DVDD is applied. | |
| 31 | SCL | — | 2 wire Bus control transmit clock input pin<br><br>Input the transmit clock to this pin for 2 wire Bus control. This pin is not corresponding to threshold tolerance of 5V.<br>Refer to:<br>Absolute Maximum Ratings, Input voltage 1 |  |
| 32 | SDA | — | 2 wire Bus control data input/output pin<br><br>Input the transmit data to this pin for 2 wire Bus control. This pin is not corresponding to threshold tolerance of 5V.<br><br>Refer to:<br>Absolute Maximum Ratings, Input voltage 1 |  |

The numerical value of I/O equivalence circuit is typical value, not guaranteed.

## Absolute Maximum Ratings (Ta=25°C)

| Item | Symbol | Limit | Unit | Conditions | |
|------|--------|-------|------|------------|---|
| Supply Voltage | $V_{CCMAX}$ | 30 | V | Pin 17, 24 | (Note 1) (Note 2) |
| | $V_{DVDDMAX}$ | 4.5 | V | Pin 10 | (Note 1) |
| Input Voltage 1 | $V_{IN1}$ | -0.3 to $V_{DVDD}$+0.3 (Note 3) | V | Pin 1 - 5, 9, 11, 29 - 32 | (Note 1) |
| Terminal Voltage 1 | $V_{PIN1}$ | -0.3 to +7.0 | V | Pin 27 | (Note 1) |
| Terminal Voltage 2 | $V_{PIN2}$ | -0.3 to +$V_{CCMAX}$ | V | Pin 16, 20, 21, 25 | (Note 1)(Note 4-1) |
| Terminal Voltage 3 | $V_{PIN3}$ | -0.3 to $V_{OUT1P}$+7 | V | Pin 26 | (Note 1)(Note 4-2) |
| | | -0.3 to $V_{OUT1N}$+7 | | Pin 22 | (Note 1)(Note 4-2) |
| | | -0.3 to $V_{OUT2P}$+7 | | Pin 19 | (Note 1)(Note 4-2) |
| | | -0.3 to $V_{OUT2N}$+7 | | Pin 15 | (Note 1)(Note 4-2) |
| Terminal Voltage 4 | $V_{PIN4}$ | -0.3 to +2.1 | V | Pin 7 | (Note 1) |
| Open-drain Terminal Voltage | $V_{ERR}$ | -0.3 to +7.0 | V | Pin13 | (Note 1) |
| Operating Temperature Range | Topr | -25 to +85 | °C | | |
| Storage Temperature Range | Tstg | -55 to +150 | °C | | |
| Junction Temperature Range | Tj | -40 to +150 | °C | | |

(Note 1) The voltage that can be applied reference to GND (Pin 8, 18, 23).
(Note 2) Do not exceed Tj=150°C.
(Note 3) Refer to Recommended Operating Ratings for $V_{DVDD}$.
(Note 4-1) This IC should be used within AC peak limits at all conditions. Overshoot should be ≤30V with reference to GND.
　　　　Undershoot should be ≤10ns and ≤30V with reference to VCCP1 and VCCP2. (Refer to figure 3-1.)
(Note 4-2) This IC should be used in lower than this rating by all means.
　　　　Undershoot should be ≤10ns and ≤( $V_{OUT1P}$ or $V_{OUT1N}$ or $V_{OUT2P}$ or $V_{OUT2N}$)+7V. (Refer to figure 3-2.)

**Caution:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

## Thermal Resistance[(Note 5)]

| Parameter | Symbol | Thermal Resistance (Typ) | | Unit |
|---|---|---|---|---|
| | | 1s[(Note 7)] | 2s2p[(Note 8)] | |
| VQFN032V5050 | | | | |
| Junction to Ambient | $\theta_{JA}$ | 138.9 | 39.1 | °C/W |
| Junction to Top Characterization Parameter[(Note 6)] | $\Psi_{JT}$ | 11 | 5 | °C/W |

(Note 5)Based on JESD51-2A(Still-Air)
(Note 6) The thermal characterization parameter to report the difference between junction temperature and the temperature at the top center of the outside surface of the component package.
(Note 7)Using a PCB board based on JESD51-3.

| Layer Number of Measurement Board | Material | Board Size |
|---|---|---|
| Single | FR-4 | 114.3mm x 76.2mm x 1.57mmt |

| Top | |
|---|---|
| Copper Pattern | Thickness |
| Footprints and Traces | 70μm |

(Note 8)Using a PCB board based on JESD51-5, 7.

| Layer Number of Measurement Board | Material | Board Size | Thermal Via[(Note 9)] | |
|---|---|---|---|---|
| | | | Pitch | Diameter |
| 4 Layers | FR-4 | 114.3mm x 76.2mm x 1.6mmt | 1.20mm | Φ0.30mm |

| Top | | 2 Internal Layers | | Bottom | |
|---|---|---|---|---|---|
| Copper Pattern | Thickness | Copper Pattern | Thickness | Copper Pattern | Thickness |
| Footprints and Traces | 70μm | 74.2mm x 74.2mm | 35μm | 74.2mm x 74.2mm | 70μm |

(Note 9) This thermal via connects with the copper pattern of all layers..

## Recommended Operating Ratings (Ta= -25°C to +85°C)

| Item | Symbol | Limit | Unit | Conditions | |
|---|---|---|---|---|---|
| Supply voltage | $V_{CCP1}$ | 10 to 24 | V | Pin 24 | (Note 1) (Note 2) |
| | $V_{CCP2}$ | 10 to 24 | V | Pin 17 | (Note 1) (Note 2) |
| | $V_{DVDD}$ | 3.0 to 3.6 | V | Pin 10 | (Note 1) |
| Minimum load impedance | $R_L$ | 6.4 | Ω | $21V < V_{CCP1}, V_{CCP2} \leq 24V$ | (Note 2) |
| | | 4.8 | Ω | $14V < V_{CCP1}, V_{CCP2} \leq 21V$ | (Note 2) |
| | | 3.6 | Ω | $V_{CCP1}, V_{CCP2} \leq 14V$ | (Note 2) |

(Note 1) The voltage that can be applied reference to GND (Pin 8, 18, 23).
(Note 2) Do not exceed Tj=150°C.

## DSP Block Functional Overview

| No. | Function | Specification |
|-----|----------|---------------|
| 1 | Pre-Scaler | · Lch / Rch become same set point.<br>· +48dB to -79dB (0.5dB step),-∞dB |
| 2 | Channel Mixer | · It is able to set mixing of Left and Right channel which are inputted digital signal to Audio DSP<br>· Selectable in L,(L+R)/2, L-R, R, MUTE |
| 3 | 12 Band BQ | · 12 Band Bi-quad(BQ) type filter .<br>· Only 5 coefficients are required.(b0,b1,b2,a1,a2)<br>· Lch/Rch dependent or independent.<br>· The Filter types which can be attained are Peaking/Low-shelf/High-shelf/Low-pass/High-pass/All-pass/Notch.<br>· There is soft transition function. |
| 4 | Fine Master Volume | · Lch / Rch become same set point or independent set.<br>· +24dB to -103dB (0.125dB step),-∞dB<br>· There are soft transition and soft mute functions. |
| 5 | 3 Band DRC | · There are 3 band DRC.<br>· It is possible to set the slope of compression level. |
| 6 | Post-scaler | · Lch / Rch become same set point.<br>· +48dB to -79dB (0.5dB step),-∞dB |
| 7 | Fine Post-scaler | · Lch / Rch become independent set point.<br>· +0.7dB to -0.8dB (0.1dB step) |
| 8 | DC cut HPF | · $1^{st}$ order HPF<br>· Cut off frequency fc : 1Hz |
| 9 | Hard Clipper | · Lch / Rch become same set point.<br>· Clip level : 0dB to -22.5dB (-0.1dB step) |

Figure 31. DSP Block diagram

## RSTX Pin[Note 12] [Note 13], MUTEX Pin function

| RSTX (29pin) | MUTEX (30pin) | DSP block | Speaker output (OUT1P, OUT1N, OUT2P, OUT2N) |
|--------------|---------------|-----------|---------------------------------------------|
| Low | Low | Reset ON | High-Z_low[Note 14]<br>(Low power consumption) |
| High | Low | Normal operation<br>(Mute ON) | High-Z_low[Note 14]<br>(Mute ON) [Note 15] |
| High | High | Normal operation<br>(Mute OFF) | Normal operation<br>(Mute OFF) |
| Low | High | Don't use. | |

(Note 12) When RSTX is set to low, internal registers are initialized.
(Note 13) If V$_{DVDD}$ is under 3V, RSTX is set to low once for 10ms(Min), and set to high again. Then DSP is needed to set parameter again.
(Note 14) This means that all output transistors are OFF and output terminals are pulled down by 10kΩ (Typ).
(Note 15) Speaker output becomes High-Z_low after elapse of PWM stop time after setting MUTEX low.
        Refer to PWM Sampling Frequency in next page for PWM stop time.

**TSZ02201-0C1C0E900290-1-2**
**01.Dec.2016 Rev.001**

**PWM Sampling Frequency**

PWM sampling frequency of speaker output, Soft mute time, Soft start time and PWM stop time depend on sampling frequency ($f_S$) of the digital audio signal. These transition times are changed by sending the data to select address 0x15[1:0].

Default = 0x3 *Blue square means initial value.

| Sampling frequency ($f_S$) | PWM sampling frequency | 0x15[1:0] value | Soft mute time | Soft start time | PWM stop time |
|---|---|---|---|---|---|
| 48kHz | 384kHz | 0x0 | 10.7ms | 10.7ms | 86ms |
|  |  | 0x1 | 21.4ms | 10.7ms | 106ms |
|  |  | 0x2 | 42.7ms | 10.7ms | 125ms |
|  |  | 0x3 | 85.4ms | 10.7ms | 162ms |
| 44.1kHz | 352.8kHz | 0x0 | 11.7ms | 11.7ms | 93ms |
|  |  | 0x1 | 23.3ms | 11.7ms | 113ms |
|  |  | 0x2 | 46.5ms | 11.7ms | 135ms |
|  |  | 0x3 | 92.9ms | 11.7ms | 177ms |
| 32 kHz | 256kHz | 0x0 | 16.1ms | 16.1ms | 116ms |
|  |  | 0x1 | 32.1ms | 16.1ms | 148ms |
|  |  | 0x2 | 64.1ms | 16.1ms | 178ms |
|  |  | 0x3 | 128.1ms | 16.1ms | 241ms |

**Setting Driver Gain (G$_{DRV}$)**

It can change the driver gain of the output FET driver part.
Set it depending on speaker used because the maximum output level changes by speaker load impedance value.

When set the driver gain, change after setting MUTEX terminal to low (>PWM stop time).
Pop noise may be occur if the driver gain is set while MUTEX=high.

Default = 0x03 *Blue square means initial value.

| Select Address | Value | Driver Gain G$_{DRV}$ (BTL) |
|---|---|---|
| 0xF3[7:0] | 0x03 | 26dB(Typ) |
| 0xF3[7:0] | 0x0B | 32dB(Typ) |

Regarding 0xF3 address,
Prohibit to set except data "0x03" and "0x0B" to address 0xF3.
The setting value is fixed by transmitting 0xF8=0x01. If the setting value of address 0xF3 is changed, certainly set 0xF8=0x01 again. In addition, Wait time more than 10ms is necessary after 0xF8=0x01 setting.

**Setting of When Monaural output**

When monaural output setting is applied as shown in Application Circuit Example3, set 0xF2 register during start-up (Refer to P.62 "7. The wake-up Procedure of power-up").
Setting 0xF2 = 0x0A, DC voltage protection function at the speaker of OUT2 side can be disabled, therefore it is possible to use Application Circuit Example3.

Default = 0x02 *Blue square means initial value.

| Select Address | Value | PWM Output Signal |
|---|---|---|
| 0xF2[7:0] | 0x02 | Stereo |
| 0xF2[7:0] | 0x0A | Monaural |

Regarding 0xF2 address,
Prohibit to set except data "0x02" and "0x0A" to address 0xF2.
The setting value is fixed by transmitting 0xF8=0x01. If the setting value of address 0xF2 is changed, certainly set 0xF8=0x01 again. In addition, Wait time more than 10ms is necessary after 0xF8=0x01 setting.

## Level Diagram

$$(1)\,DSP\,Gain = 10^{\left(\frac{V_{IN}+G_{DSP}}{20}\right)}$$

$$(2)\,Driver\,Gain(BTL) = 10^{\left(\frac{G_{DRV}}{20}\right)}$$

$$(3)\,Loss = \frac{R_L}{2(r_{DS}+r_{DC})+R_L}$$

(1)   (2)   (3)

The Duty ratio of PWM output is different from that of the DSP output.

PWM output from DSP

PWM output at FET

Speaker output signal
(BTL output)
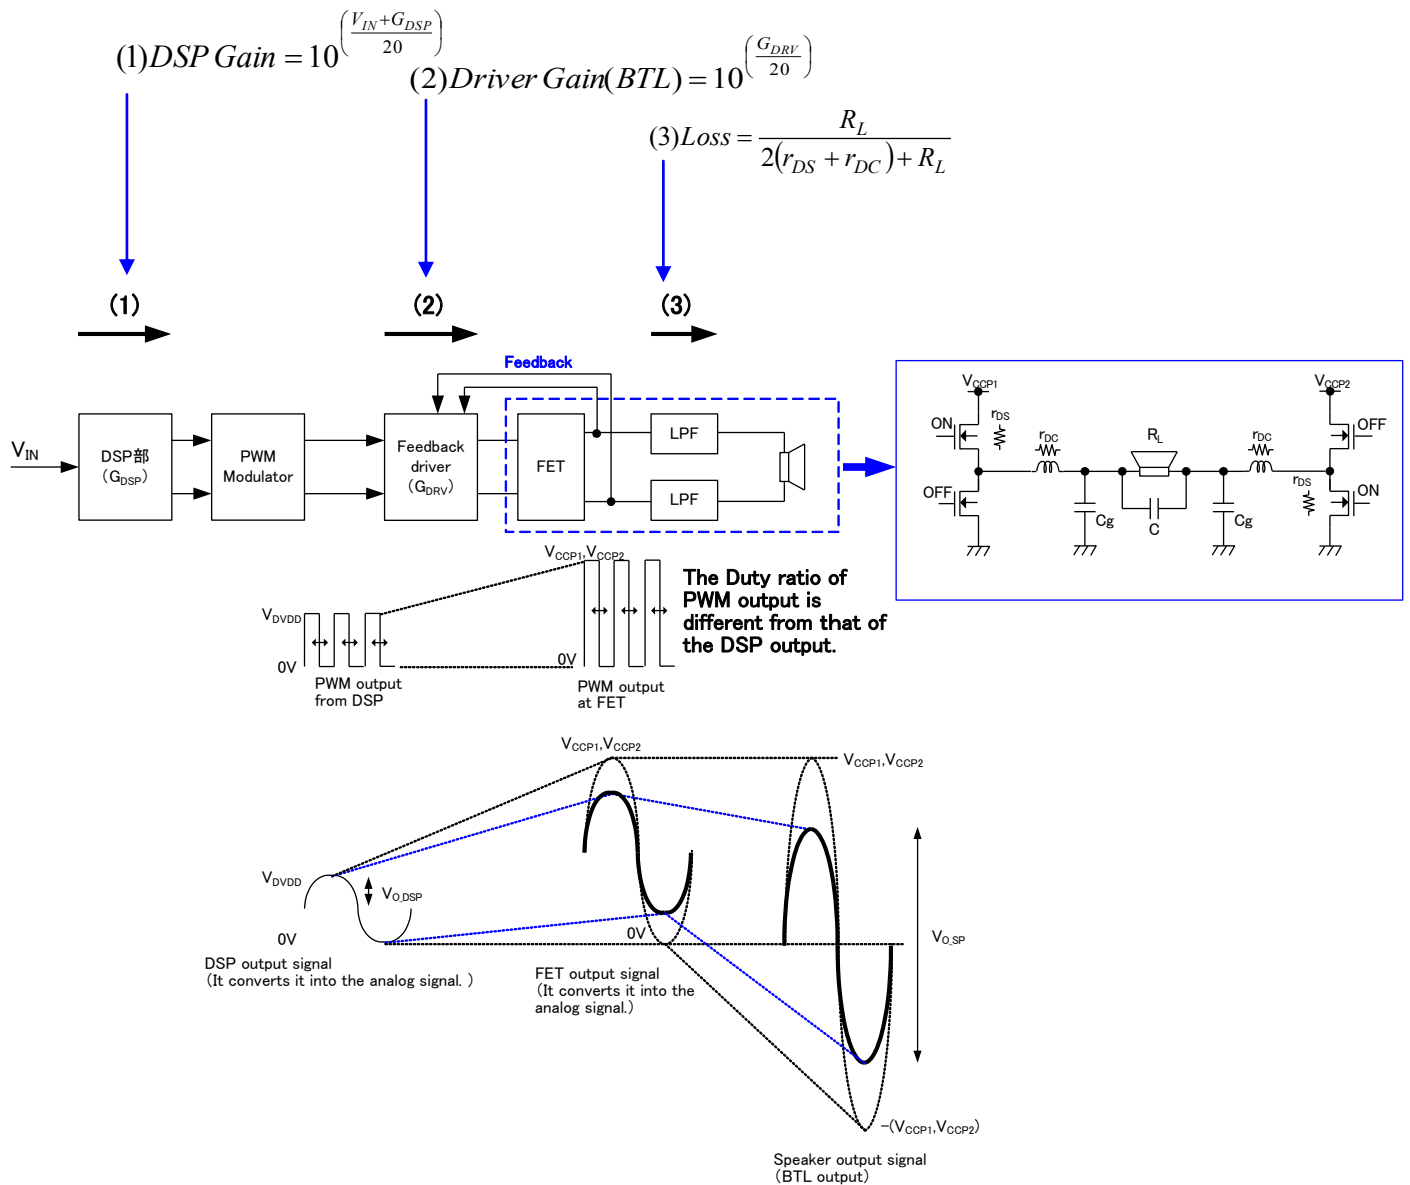

$$V_{O\_DSP} = 10^{\left(\frac{V_{IN}+G_{DSP}}{20}\right)} \quad [\text{Vrms}]$$

$$V_{O\_SP} = V_{O\_DSP} \times 10^{\left(\frac{G_{DRV}}{20}\right)} \times \frac{R_L}{2(r_{DS}+r_{DC})+R_L} \quad [\text{Vrms}]$$

$$P_{O(THD=1\%)} = \frac{\left[10^{\left(\frac{V_{IN}+G_{DSP}}{20}\right)} \times 10^{\left(\frac{G_{DRV}}{20}\right)} \times \frac{R_L}{2(r_{DS}+r_{DC})+R_L}\right]^2}{R_L} \quad [\text{W}]$$

$$P_{O(THD=10\%)} = P_{O(THD=1\%)} \times 1.25 \quad [\text{W}]$$

| | |
|---|---|
| $V_{IN}$ | : I²S input level [dBFS] |
| $G_{DSP}$ | : DSP gain [dB] |
| $G_{DRV}$ | : Feedback driver gain [dB] |
| $V_{CCP1}, V_{CCP2}$ | : Power supply voltage for power amp [V] |
| $V_{DVDD}$ | : Power supply voltage for DSP [V] |
| $R_L$ | : Speaker load resistance [Ω] |
| $r_{DS}$ | : Output FET on resistance [Ω] (Typ = 0.23Ω) |
| $r_{DC}$ | : Direct current resistance of coil [Ω] |

**2 Wire Bus Control Signal Specification**

1) Electrical Characteristics and Timing of Bus Line and I/O Stage

Figure 32

SDA and SCL bus line characteristics[Note 17] (Unless otherwise specified Ta=25°C, $V_{DVDD}$=3.3V)

| | Parameter | Symbol | High Speed Mode | | Unit |
|---|---|---|---|---|---|
| | | | Min | Max | |
| 1 | SCL clock frequency | $f_{SCL}$ | 0 | 400 | kHz |
| 2 | Bus free time between a STOP and START condition | $t_{BUF}$ | 1.3 | - | µs |
| 3 | Hold time (repeated) START condition. After this period, the first clock pulse is generated. | $t_{HD;STA}$ | 0.6 | - | µs |
| 4 | Low period of the SCL clock | $t_{LOW}$ | 1.3 | - | µs |
| 5 | High period of the SCL clock | $t_{HIGH}$ | 0.6 | - | µs |
| 6 | Set-up time for a repeated START condition | $t_{SU;STA}$ | 0.6 | - | µs |
| 7 | Data hold time | $t_{HD;DAT}$ | $0^{\text{(Note 16)}}$ | - | µs |
| 8 | Data set-up time | $t_{SU;DAT}$ | 250 | - | ns |
| 9 | Rise time of both SDA and SCL signals | $t_R$ | 20+0.1Cb | 300 | ns |
| 10 | Fall time of both SDA and SCL signals | $t_F$ | 20+0.1Cb | 300 | ns |
| 11 | Set-up time for STOP condition | $t_{SU;STO}$ | 0.6 | - | µs |
| 12 | Capacitive load for each bus line | Cb | - | 400 | pF |

The above-mentioned numerical values are all the values corresponding to $V_{IHmin}$ and the $V_{ILmax}$ level.
(Note 16) To exceed an undefined area on the fall-edge of SCL (Refer to $V_{IH}$ min of the SCL signal), the transmitting set like SoC should internally offer the holding time of 300ns or more for the SDA signal.
(Note 17) SCL and SDA pin is not corresponding to threshold tolerance of 5V.
Use it within Input voltage 1 of the absolute maximum rating.

2) Command Interface

2 wire Bus Control is used for command interface between host CPU. It not only writes but also it is possible to read it excluding a part of register. In addition to "Slave Address", set and write 1 byte of "Select Address" to read out the data. 2 wire bus Slave mode format is illustrated below.

Figure 33

| S   : | Start Condition |
|---|---|
| Slave Address   : | Data of 8bit in total is sent with a bit of Read mode (high) or Write mode (low) after slave address (7bit) set by ADDR terminal. (MSB first) |
| A   : | Acknowledge-bit will be added byte per byte in the data that acknowledge is sent and received. "low" will be sent and received when the data is correctly sent and received. There was no acknowledgement for "high". |
| Select Address   : | Use 1byte of select address. (MSB first) |
| Data   : | Sent and received data-byte data. (MSB first) |
| P   : | Stop Condition |

Start Condition
SDA ↓ SCL="High"

Stop condition
SDA ↑ SCL="High"

Figure 34

3) Slave Address

・While ADDR Pin is "low"

MSB                                                                LSB
| A6 | A5 | A4 | A3 | A2 | A1 | A0 | R/W |
|----|----|----|----|----|----|----|-----|
| 1  | 0  | 0  | 0  | 0  | 0  | 0  | 1/0 |

・While ADDR Pin is "high"

MSB                                                                LSB

| A6 | A5 | A4 | A3 | A2 | A1 | A0 | R/W |
|----|----|----|----|----|----|----|-----|
| 1  | 0  | 0  | 0  | 0  | 0  | 1  | 1/0 |

Figure 35

4) Writing of Data

・Basic format

| S | Slave Address | A | Select Address | A | Data | A | P |
|---|---------------|---|----------------|---|------|---|---|

☐ : Master to Slave, ☐ : Slave to Master

・Auto-increment format

| S | Slave Address | A | Select Address | A | Data 1 | A | Data 2 | A | Data 3…N | A | P |
|---|---------------|---|----------------|---|--------|---|--------|---|----------|---|---|

☐ : Master to Slave, ☐ : Slave to Master

Figure 36

5) Reading of Data

First of all, the address (0x20 in the example) for reading is written in the register of the 0xD0 address at the time of reading. In the following stream, data is read after the slave address. Do not return the acknowledge when ending the reception.

| S | Slave Address | A | Req_Addr | A | Select Address | A | P |
|---|---------------|---|----------|---|----------------|---|---|

(ex.)     0x80             0xD0           0x20

| S | Slave Address | A | Data 1 | A | Data 2 | A | | A | Data N | Ā | P |
|---|---------------|---|--------|---|--------|---|---|---|--------|---|---|

(ex.)     0x81           0x**        0x**                    0x**

☐ : Master to Slave, ☐ : Slave to Master, A : With Acknowledge, Ā : Without Acknowledge

**Format of Digital Audio Interface**

- LRCLK:   It is L/R Clock Input Signal
  It is available of 32kHz/44.1kHz/48kHz with those clocks ($f_S$) that are same to the sampling frequency ($f_S$).
  The data of the left channel and the right channel for one sample is input to this section.

- BCLK:    It is Bit Clock Input Signal
  It is used for the latch of data in every one bit by sampling frequency's 32 times frequency ($32f_S$) or 48 times frequency ($48f_S$) or 64 times sampling frequency ($64f_S$). However if the $32f_S$ is selected, the data length is held static of 16bit.

- SDATA: It is Data Input Signal
  It is amplitude data. Word length is different according to the resolution of the input digital audio signal.
  It is available of 16/ 20/ 24 bit.

  The digital input format is available of I²S, Left-justified and Right-justified formats.
  The figure below shows the timing chart of each transmission mode.

- SDATAO: Audio Data Output After DSP Processing
  This output syncs with inputted LRCLK and BCLK.
  Output format is available of I²S format only.

BCLK Clock 64$f_S$

## I²S 64fs Format

**Format Setting for Digital Audio Interface**
Set BCLK clock $f_S$, word length and data format by transmitting command according to the inputted digital audio signal.
SDATAO output word length is able to be set independently of input word length.
It is available of $I^2S$ format only.

BCLK Clock
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x03[ 5:4 ] | 0x0 | 64$f_S$ |
| | 0x1 | 48$f_S$ |
| | 0x2 | 32$f_S$ |
| | 0x3 | Don't use |

Data Format
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x03[ 3:2 ] | 0x0 | $I^2S$ format |
| | 0x1 | Left-justified format |
| | 0x2 | Right-justified format |
| | 0x3 | Don't use |

Word Length
Default = 0x2 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x03[ 1:0 ] | 0x0 | 16 bit |
| | 0x1 | 20 bit |
| | 0x2 | 24 bit |
| | 0x3 | Don't use |

SDATAO Output Word Length
Default = 0x2 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x78[ 1:0 ] | 0x0 | 16 bit |
| | 0x1 | 20 bit |
| | 0x2 | 24 bit |
| | 0x3 | Don't use |

(Note) When power supply shut-down sequence is executed, before doing RSTX high ⇒ low, set MUTEX high ⇒ low and hold Wait time > PWM stop time.

**Protection Function**

About ERRORX pin (Pin 13)
If IC detects Output short protection or DC voltage protection or high temperature protection, IC informs abnormality with ERRORX pin as low level in the protection function operation. This is a function indicating the abnormal condition of this product.
ERRORX terminal does not become low in the case of detecting Under voltage protection or Clock stop protection.

| Protection function | | Detecting & Releasing condition | Speaker PWM output | ERRORX Output[19] |
|---|---|---|---|---|
| Output short protection | Detecting condition | Detecting current = 10A (Typ) / 5A (Min, Tj=85°C) / 3.9A (Min, Tj=150°C) | High-Z_low (Latch) [20] | Low (Latch) |
| DC voltage protection | Detecting condition | PWM output Duty ratio=0% or 100% for 42ms(Typ, $f_S$=48kHz)and over | High-Z_low (Latch) [20] | Low (Latch) |
| High temperature protection | Detecting condition | Chip temperature to be more than 150°C (Min) | High-Z_low | Low |
| | Releasing condition | Chip temperature to be less than 120°C (Min) | Normal operation | |
| Under voltage protection | Detecting condition | Power supply voltage to be below 7.0V (Typ) / 6.0V (Min) / 8.0V (Max) | High-Z_low | High |
| | Releasing condition | Power supply voltage to be above 7.5V (Typ) / 6.5V (Min) / 8.5V (Max) | Normal operation | |
| Clock stop protection | Detecting condition | BCLK signal has stopped more than constant period of time. LRCLK signal has stopped more than constant period of time. BCLK frequency becomes lower than constant frequency speed. BCLK frequency becomes higher than constant frequency speed. Clock stop protection is detected if any of the condition described above happens. Refer to P.58-61. | High-Z_low | High |
| | Releasing condition | LRCLK has not stopped more than constant period of time. And BCLK frequency keeps between the constant frequency speed more than maximum 60ms.Refer to P.58-61. | Normal operation | |

(Note 19) The ERRORX pin is Nch open-drain output. The ERRORX output pin should be pulled-up by external resistor.
(Note 20) Once IC is latched, the circuit will not be released automatically even after the abnormal condition has been removed.
The following procedure is available for recovery.
To let IC return from latch state, set MUTEX pin to low once for more than PWM stop time and then return it back to high.

(1)  Output Short Protection (Short to the Power Supply)
This IC has the output short protection circuit that mutes the PWM output when the PWM output is short-circuited to the power supply unintentionally.

Detecting condition - It will detect when MUTEX pin is set high and the current that flows in the PWM output pin becomes over 10A(Typ) more than 0.3μs(Typ). The PWM output immediately transition to the state of High-Z_low if detected, and IC does the latch.

Releasing method - Set MUTEX pin to low once for more than PWM stop time(Refer to P.19) and then return it back to high.
Figure 45. Output short protection (Short to the power supply) sequence

(2)  Output Short Protection (Short to GND)
This IC has the output short protection circuit that mutes the PWM output when the PWM output is short-circuited to GND unintentionally.

Detecting condition - It will detect when MUTEX pin is set high and the current that flows in the PWM output terminal becomes over 10A(Typ) more than 0.4μs(Typ). If Output short protection is detected, the PWM output immediately transition to the state of High-Z_low, and IC latches the stop state.

Releasing method -  Set MUTEX pin to low once for more than PWM stop time(Refer to P.19) and then return it back to high.

Figure 46. Output short protection (Short to GND) sequence

(3) DC Voltage Protection for Speaker

When the DC voltage is applied to the speaker unintentionally, the embedded DC Voltage Protection circuit mute the PWM output circuit for preventing the speaker from destruction.

Detecting condition - It will detect when MUTEX pin is set to high and PWM output Duty ratio=0% or 100% over 42ms (fs=48kHz).The PWM output immediately transition to the state of High-Z_low if detected, and IC does the latch.

Releasing method - Set MUTEX pin to low once for more than PWM stop time(Refer to P.19) and then return it back to high.

Figure 47. DC voltage protection in the speaker sequence

**01.Dec.2016 Rev.001**

(4)  High Temperature Protection
This IC has the high temperature protection circuit that prevents from thermal runaway under an abnormal state for the temperature of the chip to exceed Tj=150°C(Min).
Detecting condition - It will detect when MUTEX pin is set to high and the temperature of the chip becomes 150°C (Min) or more. The speaker output immediately transition to the state of High-Z_low.
Releasing condition - It will release when MUTEX pin is set to high and the temperature of the chip becomes 120°C (Min) or less. If this protection is released, the PWM output terminal return to output PWM signal state (Auto recovery).
Figure 48. High temperature protection sequence

(5) Under Voltage Protection

This IC has under voltage protection circuit that makes PWM output mutes when extreme drop of the power supply voltage is detected.

Detecting condition - It will detect when MUTEX pin is set to high and the power supply voltage becomes lower than 7.0V(Typ). The speaker output immediately transition to the state of High-Z_low when detected.

Releasing condition - It will be released when MUTEX pin is set to high and the power supply voltage becomes more than 7.5V(Typ). If this protection is released, the PWM output terminal return to output PWM signal state (Auto recovery).
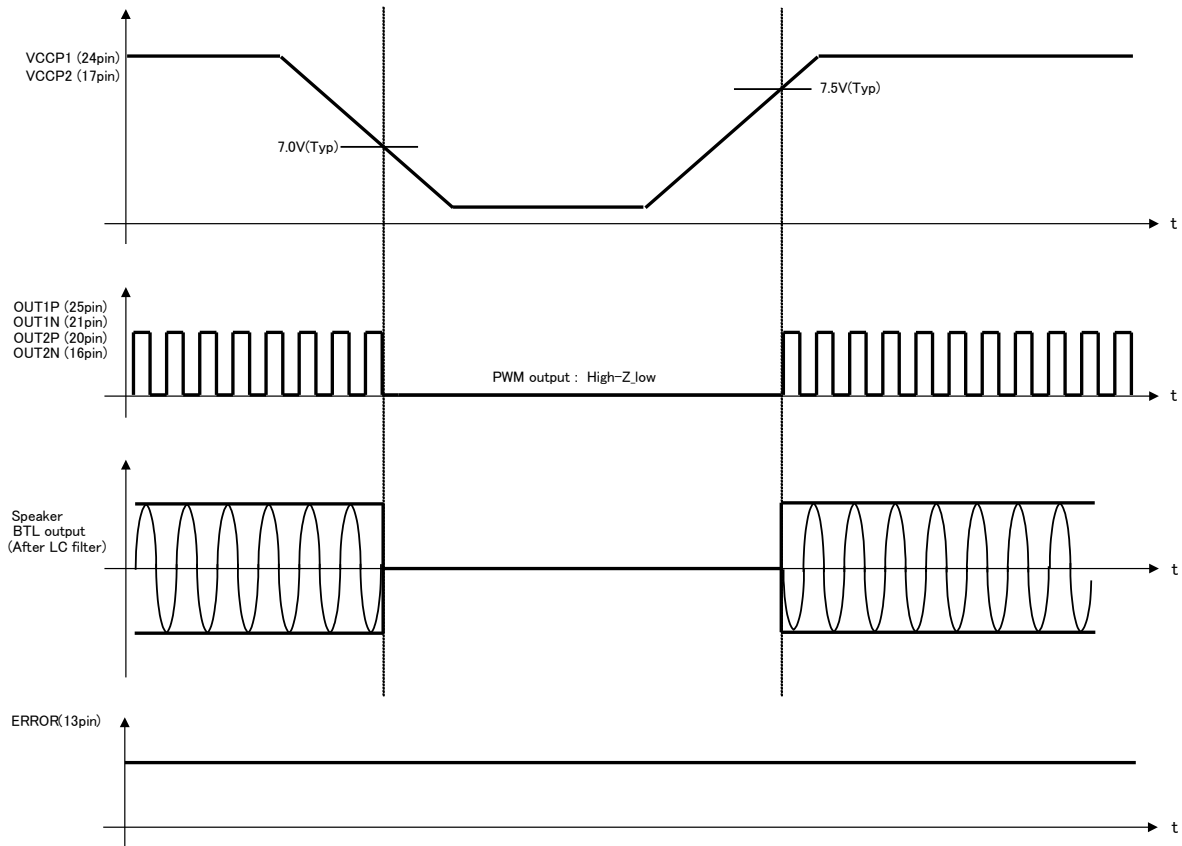

Figure 49. Under voltage protection sequence

(6)  Clock Stop Protection
This IC has the clock stop protection circuit that makes PWM output mutes when the BCLK and LRCLK frequency of the digital audio signal are stopped or become high frequency or become low frequency more than given period.
Detecting condition - If BCLK frequency is stop or high or low, LRCLK frequency is stop.
The speaker output immediately transition to the state of High-Z_low when detected.
Releasing condition - If BCLK and LRCLK are normal input over 60ms (Max) and more.
After 60ms (Max) from releasing, the PWM output terminal return to output PWM signal state after soft start (Auto recovery).
Figure 50. Clock stop protection sequence

## 1. Digital Sound Processing(DSP)

The digital sound processing (DSP) part of BM28723MUV is composed of special hardware which is optimal for TV and Mini/Micro Component System. BM28723MUV does the following processing using this special DSP.
Pre-Scaler, Channel mixer, 12 Band BQ, Fine Master Volume, 3 Band DRC, Fine Post-scaler,
DC Cut HPF, Hard Clipper

The outline and signal flow of the DSP part

| | |
|---|---|
| Data width: | 32 bit　(DATA　RAM) |
| Machine cycle: | 20.3ns (1024$f_S$, $f_S$=48kHz) |
| Multiplier: | 32×24 → 56 bit |
| Adder: | 56 + 56 → 56 bit |
| Data RAM: | 512×32 bit |
| Coefficient RAM: | 512×24 bit |
| Sampling frequency: | $f_S$=32k, 44.1k, 48kHz |
Figure 51

Digital signal from 16bit to 24bit is inputted to the DSP but extends 8bit (+48dB) as the overflow margin to the MSB side. When the processing is over this range, it will be clip processing inside DSP. Note that in case of commonly used second IIR-type (BQ) filter is the digital filter, output of the internal multiplier and adder will consume a lot of overflow margin.

The output of multipliers and the adder might exceed +48dB by the coefficient of a1, a2, b0, b1, and b2. In that case, data becomes saturation output. Therefore, the output of the filter cannot obtain the aimed characteristic.

Direct form 1

-1 is multiplied by the coefficient of a1 and a2.
Considering efficiency of calculation at DSP.
Figure 52

The management of audio data and coefficient data is as follows by each block.

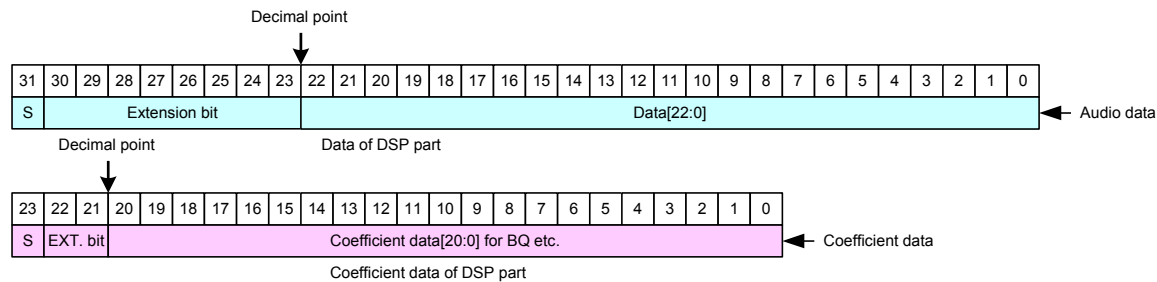

Figure 53

1-1. Bypass

There are commands to bypass selected DSP functions. This bypass can be set even the setting values are remained for each function; therefore, it is easy to check ON/OFF of the sound effect.
There are three bypass options, which are 12Band BQ, 3Band DRC or the whole DSP except Hard Clipper.

Figure 54

Default = 0x0

| Select Address | bit | Explanation of operation | | |
|---|---|---|---|---|
| 0x02 [2:0] | 2 | Bypass of 12 Band BQ (SW1) | 0:Normal | 1:Bypass |
| | 1 | Bypass of 3 Band DRC (SW2) | 0:Normal | 1:Bypass |
| | 0 | Bypass of DSP (SW3) (Except Hard Clipper) | 0:Normal | 1:Bypass |

1-2. Pre-Scaler

To overflow when the level sometimes is full scale entry in case of the digital signal which is inputted to the sound DSP and does surround and equalizer processing, it adjusts an entry gain with Pre-Scaler. The adjustable-range can be set from +48 dB to -79 dB with the 0.5dB step. (Lch/Rch dependent control)
Pre-Scaler does not have the soft transition function.

Default = 0x60 *Blue square means initial value.

| Select Address | Explanation of operation |

| 0x16 [ 7:0 ] | <table><tr><td>Value</td><td>Gain</td></tr><tr><td>0x00</td><td>+48dB</td></tr><tr><td>0x01</td><td>+47.5dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0x60</td><td>0dB</td></tr><tr><td>0x61</td><td>-0.5dB</td></tr><tr><td>0x62</td><td>-1dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0xFE</td><td>-79dB</td></tr><tr><td>0xFF</td><td>-∞</td></tr></table> |

1-3. Channel Setup with a Phase Inversion Function    Channel Mixer 1

This function mixes the sound on the left channel and the right channel of the digital signal which was inputted to the DSP. Here, it changes stereo signal to monaural. In addition, the phase-inversion, the mute on each channel can be set.

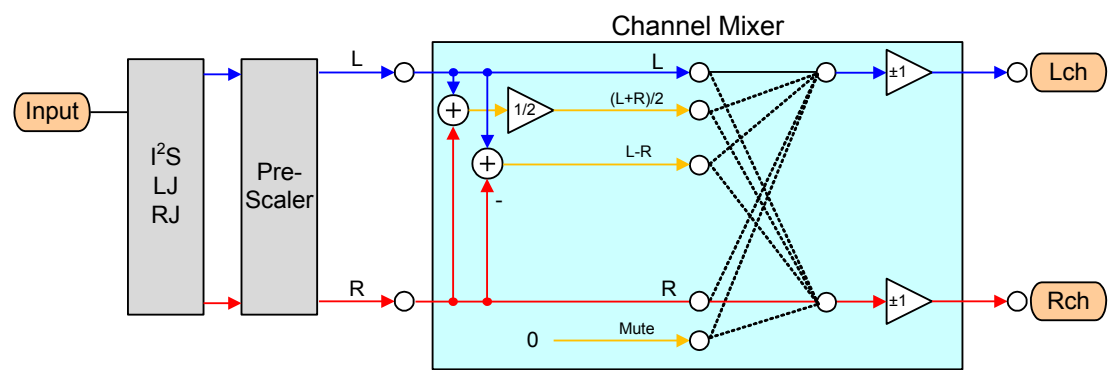

Figure 55

DSP Input: The data inputted into Lch of DSP is inverted.
Default = 0x0 *Blue square means initial value.

1-4. Bi-quad type filter

This IC has the following blocks that have a feature of the Bi-quad type filter:
12 Band BQ, Crossover filter of 3Band DRC block and BQ of the soft transition.
The shapes that can be used are peaking filter, low shelf filter, high shelf filter, low pass filter, high pass filter, all path filter and notch filter.
Setting the coefficient of the digital filter(b0, b1, b2, a1, a2) in the IC by transmitting to the coefficient RAM via command.
12 Band BQ have the soft transition function. Note that the detailed order of the parameter setting refers to the following BQ setting method.

Select of BQ independent or dependent setting
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x60 [ 4 ] | 0x0 | L/R dependent setting |
| | 0x1 | L/R independent setting |

0x60[4] setting note.
Reset all the Bi-quad type filters when you change the setting of 0x60[4].
The Bi-quad type filters for which the re-setting is necessary are 18 BQs of BQ1-12, DRC1,DRC2 and DRC3(Each DRC has 2 band).

Select the destination of BQ soft transition
Default = 0x00 *Blue square means initial value.

| Select Address | Explanation of operation | | | |
|---|---|---|---|---|
| 0x51 [ 4:0 ] | Value | Destination | Value | Destination |
| | 0x00 | 12BAND(1) | 0x0A | 12BAND(11) |

1-5. Volume setting

Volume is from +24dB to -103dB, and can be selected by the step of 0.125dB. And it is also possible to be set to -∞dB. L/R independent or L/R dependent can be selected by 0x10[7]. At the time of switching of Volume, soft transition is executed. Soft transition duration is optional with the command.
It becomes the following formula at the transition from AdB to BdB. C is soft transition duration selected by 0x15[7:6] command.

$$\text{Transition time} = \left| \left( 10^{\left(\frac{A}{20}\right)} - 10^{\left(\frac{B}{20}\right)} \right) \times C \right| \quad [\text{ms}]$$

Setting of soft transition time
    Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x15 [ 7:6 ] | 0x0 | 21.3ms |
| | 0x1 | 42.7ms |
| | 0x2 | 85.3ms |
| | 0x3 | Don't use |

Lch/dependent volume setting
    Default = 0xFF *Blue square means initial value.

| Select Address | Explanation of operation |
|---|---|
| 0x11 [ 7:0 ] | Value / Gain: 0x00 +24dB; 0x01 +23.5dB; ⋮ ⋮; 0x30 0dB; 0x31 -0.5dB; 0x32 -1dB; ⋮ ⋮; 0xFE -103dB; 0xFF -∞ |

Fine volume setting function becomes effective by sending the following command.
When using this command, it is possible to set a volume in 0.125dB step.
When L/R dependent volume setting, 0x11[7:0] is enable.
When L/R independent volume setting, 0x11[7:0] is the volume setting of Lch.

Lch/dependent fine volume setting
    It is possible to use with the 0.5dB step in changing only 0x11[7:0] when 0x10[1:0]=0x0.
    Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x10 [ 1:0 ] | 0x0 | 0dB |
| | 0x1 | -0.125dB |
| | 0x2 | -0.25dB |
| | 0x3 | -0.375dB |

The Lch/Rch independent volume setting and the dependent volume setting can be selected by 0x10[7] command.
When Lch/Rch independent volume set, the volume setting of Lch is the setting of 0x10[1:0] and 0x11, and the volume setting of Rch is the settings of 0x10[5:4] and 0x12.

Setting of Lch/Rch independent volume
　　Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x10[ 7 ] | 0x0 | Lch/Rch dependent volume setting |
| | 0x1 | Lch/Rch independent volume setting |

Setting of volume (Setting of Rch volume, It is enable only to set an independent volume.)
　　Default = 0xFF *Blue square means initial value.

| Select Address | Explanation of operation |
|---|---|
| 0x12 [ 7:0 ] | <table><tr><td>Value</td><td>Gain</td></tr><tr><td>0x00</td><td>+24dB</td></tr><tr><td>0x01</td><td>+23.5dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0x30</td><td>0dB</td></tr><tr><td>0x31</td><td>-0.5dB</td></tr><tr><td>0x32</td><td>-1dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0xFE</td><td>-103dB</td></tr><tr><td>0xFF</td><td>-∞</td></tr></table> |

Fine volume setting function becomes effective by sending the following command.
When using this command, it is possible to set a volume in 0.125dB step.

Setting of fine volume (Setting of Rch fine volume, It is enable only to set an independent volume.)
　　It is possible to use with the 0.5dB step in changing only 0x12[7:0] when 0x10[5:4]=0.
　　Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x10 [ 5:4 ] | 0x0 | 0dB |
| | 0x1 | -0.125dB |
| | 0x2 | -0.25dB |
| | 0x3 | -0.375dB |

It is possible to use with the 0.125dB step in setting both 0x10[1:0] and 0x11[7:0].
　　In case of 0x10[1:0]=0x0, it becomes the set value of 0x11[7:0].
　　In case of 0x10[1:0]=0x1, it becomes the -0.125dB set value of 0x11[7:0].
　　In case of 0x10[1:0]=0x2, it becomes the -0.25dB set value of 0x11[7:0].
　　In case of 0x10[1:0]=0x3, it becomes the -0.375dB set value of 0x11[7:0].
Since the transfer of 0x11 fixes it in any case, the soft transition can be beforehand begun in the set value for the direct following of the purpose in setting 0x11 after setting in 0x10.
0x10[5:4] is the same function as 0x10[1:0], 0x12 is the same function as 0x11 when Lch/Rch independently set for Rch.

1-6. 3 Band DRC

This DRC is used in order to prevent speaker protection and the clip output of a large audio signal.
There are three kinds of DRC (DRC1, DRC2, and DRC3), and no clip can be output to each three BAND.
DRC1, DRC2 and DRC3 can set up two threshold levels. Moreover, it is possible to also change slope.

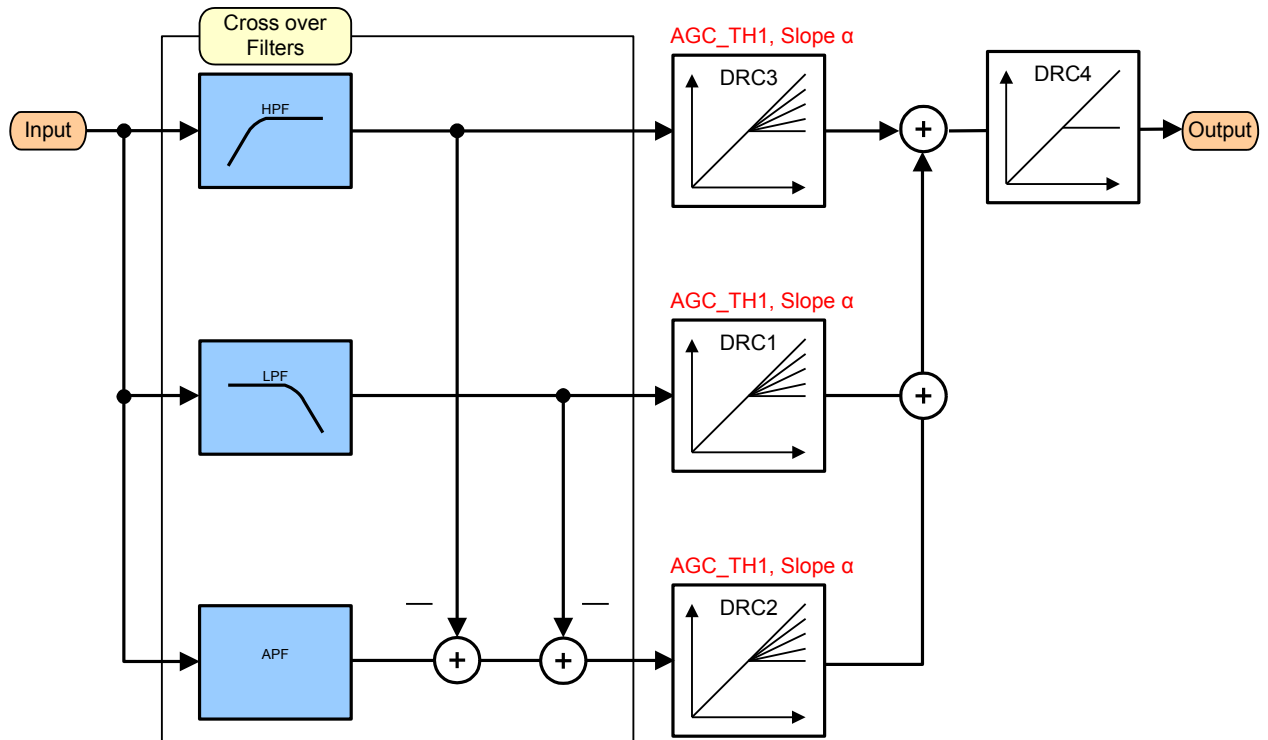

Figure 57

DRC transition figure

In here A_TIME is the time for detecting time before gain starts to decrease. And A_RATE decides the slope of gain compression.

On the other hand R_TIME is the time for detecting before starting to release gain operation. And R_RATE decides slope of release gain.

Figure 58

DRC1, DRC2, DRC3 can be set 2 types of threshold(AGC_TH1 and AGC_TH2) as shown below. If output is in between AGC_TH1 and AGC_TH2, a slant for output gain can be made. If input become bigger and output over AGC_TH2, output gain don't have slant and become constant level. Slope setting (α) is calculated by AGC_TH1, AGC_TH2 and the value of input gain to DRC block for reaching AGC_TH2 (xdB).

The operation between AGC_TH1 and AGC_TH2 is named as DRC1$_{slope}$ and DRC2$_{slope}$ and DRC3$_{slope}$.

And the operation over AGC_TH2 is named as DRC1$_{comp}$ and DRC2$_{comp}$ and DRC3$_{comp}$.

Each operation can be set ON/OFF, A_TIME, A_RATE, R_TIME, R_RATE respectively.

For example, DRC1 do not have slope curve when setting DRC1$_{slope}$ OFF and DRC1$_{comp}$ ON.

DRC4 can be set only AGC_TH2 therefore DRC4 do not have slope function.

DRC input-and-output gain characteristics

Figure 59

The formula which asks for Slope α is described below.
α changes into 8bit Hex data of the complement of 2 the value calculated by calculation.

$$\alpha = \frac{10^{\frac{y}{20}} - 10^{\frac{x}{20}}}{10^{\frac{TH}{20}} - 10^{\frac{x}{20}}} \times 128$$

TH is AGC_TH1. x is input level. y is output level.

Ex) It asks for α at the time of AGC_TH1 = −12dB, x = 0dB y = −6dB

$$\alpha = \frac{10^{\frac{-6}{20}} - 10^{\frac{0}{20}}}{10^{\frac{-12}{20}} - 10^{\frac{0}{20}}} \times 128$$

α = 85.266 → 0x55

0x55 calculated is set to command 0x29, 0x31 or 0x39.

## 1-7. Post-scaler

Post-scaler is used to adjust the gain of post DSP processing data.
The adjustable-range can be set from +48dB to -79dB with the 0.5dB step. (Lch/Rch dependent control)
Pre-Scaler does not have a soft transition function.

Default = 0x60 *Blue square means initial value.

| Select Address | Explanation of operation |
|---|---|
| 0x13 [ 7:0 ] | <table><tr><th>Value</th><th>Gain</th></tr><tr><td>0x00</td><td>+48dB</td></tr><tr><td>0x01</td><td>+47.5dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0x60</td><td>0dB</td></tr><tr><td>0x61</td><td>-0.5dB</td></tr><tr><td>0x62</td><td>-1dB</td></tr><tr><td>⋮</td><td>⋮</td></tr><tr><td>0xFE</td><td>-79dB</td></tr><tr><td>0xFF</td><td>-∞</td></tr></table> |

## 1-8. Fine Post-scaler

This function block is located after Post-scaler. An adjustable ranges can be set up from +0.7dB to –0.8dB at 0.1dB step.
Fine Post-scaler does not have a soft transition function.
(Independent control of Lch/Rch.)

Default = 0x8 *Blue square means initial value.

| Select Address | Explanation of operation | | | |
|---|---|---|---|---|
| Lch   0x14 [ 7:4 ]<br><br>Rch   0x14 [ 3:0 ] | Value | Gain | Value | Gain |
| | 0x0 | -0.8dB | 0x8 | 0dB |
| | 0x1 | -0.7dB | 0x9 | +0.1dB |

| | 0x6 | -0.2dB | 0xE | +0.6dB |
| | 0x7 | -0.1dB | 0xF | +0.7dB |

1-9. Hard Clipper

Measure the rated output power (practical maximum output power) of TV or any audio products at the 10% of Total Harmonic Distortion (THD+N). It can be made to clip with any output amplitude by using a clipper function. For example, the rated output of 10W or 5W can be gained using the amplifier of 15W output.

Hard clip

Figure 61

Clipper setting
Default = 0x1 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x1A [ 0 ] | 0x0 | Not use Clipper function |
| | 0x1 | Use Clipper function |

Clip level selection
Default = 0xE1 *Blue square means initial value.

1-10. DC Cut 1$^{st}$ order HPF

DC offset element of the digital signal from audio DSP is cut by this HPF.
The cutoff frequency fc of HPF uses the 1Hz filter, and the degree uses the first-order filter.

Default = 0x1 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x18 [ 0 ] | 0x0 | Not use DC Cut HPF |
|  | 0x1 | Use DC Cut HPF |

1-11. RAM Clear

The data RAM of DSP and coefficient RAM are cleared.
40μs or more is required until all the data is cleared.
After "RAM Clear" state keeps 40μs or more, change the mode "RAM Clear" to "Normal".

Clear of the data RAM
Default = 0x1 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x01 [ 7 ] | 0x0 | Normal |
|  | 0x1 | Clear operation |

Clear of coefficient RAM
Default = 0x1 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x01 [ 6 ] | 0x0 | Normal |
|  | 0x1 | Clear operation |

1-12. Audio Output Level Meter

It is possible to output the peak level of the PCM data inputted into a PWM processor.
A peak value can be read using the 2 wire command interface as 16 bit data of an absolute value.
The interval holding a peak value can be selected from six steps (50ms step) from 50ms to 300ms.
A peak hold result can be selected from L channel, R channel, and a monaural channel {(Lch+Rch) /2}.

Audio Output Level Meter block diagram

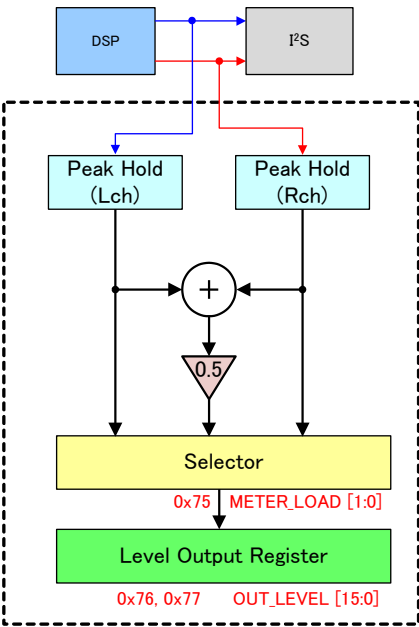

Figure 62

Setting of the peak level hold time interval of Audio Output Level Meter
Default = 0x00 *Blue square means initial value.

| Select Address | Explanation of operation | |
| --- | --- | --- |
| 0x74 [ 2:0 ] | Value | Hold time |
| | 0x0 | 50ms |
| | 0x1 | 100ms |
| | 0x2 | 150ms |
| | 0x3 | 200ms |
| | 0x4 | 250ms |
| | 0x5 | 300ms |

Specify the read-target signal of Audio Level Meter.
A value will be taken into a read-only register if a setting value is written in.
In order to update this register value, it is necessary to write in a setting value again.

Write only

| Select Address | Value | Explanation of operation |
| --- | --- | --- |
| 0x75 [ 1:0 ] | 0x0 | The peak level of L channel |
| | 0x1 | The peak level of R channel |
| | 0x2 | The peak level of monaural channel {(Lch+Rch) /2} |

Read-back of Audio Output Level
0x76 (upper 8 bits) and a 0x77 (lower 8 bits) commands are read for the maximum within the period appointed by the command 0x74 using the 2 wire interface.

(Example)
When 0xFFFF is read, mean 1.0 (0dBFs).
When 0x8000 is read, mean 0.5 (-6dBFs).

## 2. Setting and reading method of BQ

It explains a detailed sequence of the setting method and the reading method of BQ separately for usage.

### 2-1 BQ coefficient setting

BQ consists of Bi-quad filter as follows. Each coefficient b0,b1,b2,a1and a2 of BQ can be written directly.
It is S2.21 format, and setting range is -4≤x<+4.
Moreover, the coefficient address is shown in Table 1.

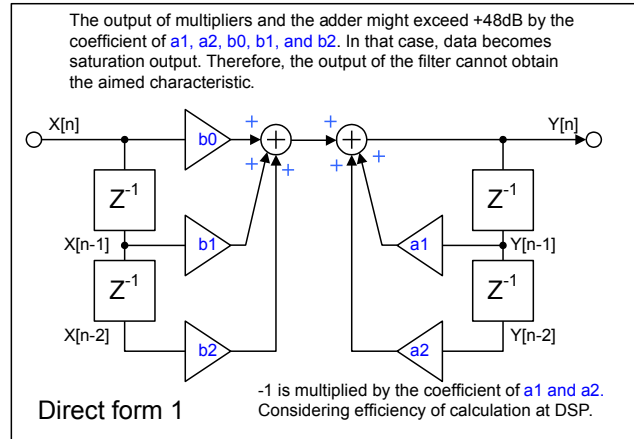

Figure 63

### 2-1-1 Writing sequence (Set in numerical order)

1. Address setting (0x61)　Refer to Table 1.
2. 24bit coefficient upper [23:16] bit setting (0x62[7:0])
3. 24bit coefficient middle [15:8] bit setting (0x63[7:0])
4. 24bit coefficient lower [7:0] bit setting (0x64[7:0])
5. The writing of coefficients is performed. (0x65[0] = 0x1) *

\* After completion of writing coefficients this register is cleared automatically. It is not necessary to write 0x65[0] = 0x0.
Coefficient writing takes about 100µs.
100µs should not change an address setup and 24-bit coefficient setup after coefficient write-in execution.

(ex) When 0x3DEDE7 is written, same L/Rch, 12band BQ1 b0
1. 0x61 = 0x00 (12band BQ1 b0 is appointed)
2. 0x62 = 0x3D (Upper [23:16] is setting)
3. 0x63 = 0xED (Middle [15:8] is setting)
4. 0x64 = 0xE7 (Lower [7:0] is setting)
5. 0x65 = 0x01 (Coefficient transfer)*
*After completion of writing coefficients this register is cleared automatically.
6. 100µs or more wait
Write other coefficients.

### 2-1-2 Read-back sequence (Set in numerical order)

1. Address setting (0x61)　Refer to Table 1.
2. Setting of a read-back register address (0xD0)　Refer to P.22 "5) Reading of Data"
3. Read-back of the 24bit coefficient upper[23:16]bit (0x66[7:0])
4. Read-back of the 24bit coefficient middle[15:8]bit (0x67[7:0])
5. Read-back of the 24bit coefficient lower[7:0]bit (0x68[7:0])

### 2-1-3 When the coefficient of BQ is set up directly and a soft transition is performed
1. Set BQ coefficient to soft transition addresses. The addresses are 0x50-0x54. Please refer to Table1.
   Since in the case of 0x60[4] = 0x1(Enable L/R independent setting) and 0x53[5:4] = 0x0 a soft transition is carried out and it is set to LR simultaneously, please write a coefficient in both LR address.
   In the case of 0x53[5:4] = 0x1, coefficient is set to only Lch address.
   In the case of 0x53[5:4] = 0x2, coefficient is set to only Rch address.
2. Select BQ Band that is performed soft transition by setting 0x51[4:0] address.(Refer to chapter 1-4)
3. 0x58[0] = 0x1 : Start soft transition (After the completion of soft transition this register is automatically cleared 0x0.)
4. Wait soft transition completion, or read command 0x59[0], and wait until it 0x59[0] cleared (0x0).

Table1. Specified coefficient

| 0x61[6:0] Value | Select coefficient | 0x61[6:0] Value | Select coefficient | 0x61[6:0] Value | Select coefficient |
|---|---|---|---|---|---|
| 0x00 | 12BandBQ1 b0 | 0x23 | 12BandBQ8 b0 | 0x46 | DRC2_1 b0 |
| 0x01 | 12BandBQ1 b1 | 0x24 | 12BandBQ8 b1 | 0x47 | DRC2_1 b1 |

| 0x22 | 12BandBQ7 a2 | 0x45 | DRC1_2 a2 | | |

When L/R independent, Lch:0x61[7]=0x0, Rch: 0x61[7]=0x1
When L/R dependent, 0x61[7] is not reflected.

### 3. Mute Function by MUTEX terminal

BM28723MUV can mute output by setting the MUTEX terminal to "low".

Transition time setting at the time of mute is as follows.
Soft transition mute time setting
The transition time when changing to a mute state is selected.
The soft transition time at the time of mute release is 10.7ms fixed.

Default = 0x3 *Blue square means initial value.

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x15 [ 1:0 ] | 0x0 | 10.7ms ($f_S$=48kHz) |
| | 0x1 | 21.4ms ($f_S$=48kHz) |
| | 0x2 | 42.7ms ($f_S$=48kHz) |
| | 0x3 | 85.4ms ($f_S$=48kHz) |

0x15[1:0] Mute time setting
It is only operated to mute by MUTEX terminal.

Figure 64

0x15[1:0] setting

| Value | $T_A$ | $T_B$ |
|---|---|---|
| 0x0 | 10.7ms | 10.7ms |
| 0x1 | 21.4ms | 10.7ms |
| 0x2 | 42.7ms | 10.7ms |

### 4. Small Signal Input Detecting Function

There is a function which detects the audio data input of a non-signal or a small signal. This function is used in order to reduce the standby power consumption of an audio set.
If the signal below a setting detection level continues in both L channel and R channel, a small signal detection flag will become "high". A detection result can be read from command 0x72 [0].
The point which acts as a monitor of the small signal becomes input data of audio DSP block.
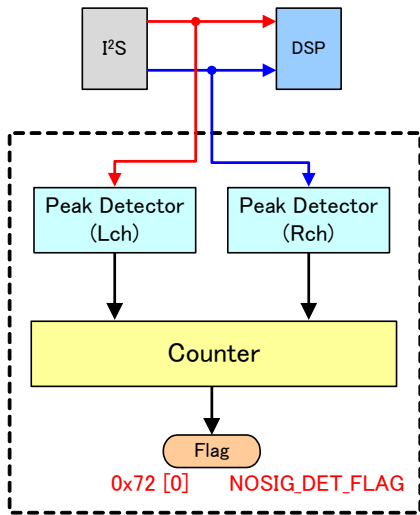

Figure 66. Block diagram of Small Signal Input Detecting

Detection level setting
Default = 0x00 *Blue square means initial value.

| Select Address | Explanation of operation | | | | | |
|---|---|---|---|---|---|---|
| 0x70 [ 4:0 ] | Value | Level | Value | Level | Value | Level |
| | 0x00 | -103dB | 0x08 | -77dB | 0x10 | -69dB |
| | 0x01 | -93dB | 0x09 | -76dB | 0x11 | -68dB |
| | 0x02 | -91dB | 0x0A | -75dB | 0x12 | -67dB |
| | 0x03 | -87dB | 0x0B | -74dB | 0x13 | -66dB |

**5. Clock Stop Detection and detection of high speed and low speed or detection of out of sync**

5-1. Clock Stop Detection

BM28723MUV generates internal clock using for audio data processing from inputted several clocks.
By stopping these clock sources, the clocks that is used for audio data processing also stop (Or if that clock does not reach the frequency speed needed).
Therefore the detection circuit is needed to avoid that situation.
State of BCLK and LRCLK are detected by using internal clock.
If valid flag is detected, output is muted(Immediate mute).

Figure 67

Each clock stop is detected when inputted clock stop during the time that is set by command. Detection result can be read back by command.
In addition, once stop flag is detected, these flag cannot be cleared until clear command is send even though the clock speed becomes normal.

LRCLK stop detection time
    Default = 0x2 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| LRCLK   0x07 [ 2:0 ] | 0x0 | 10μs to 20μs |
|  | 0x1 | 20μs to 40μs |
|  | 0x2 | 50μs to 100μs |
|  | 0x3 | 100μs to 200μs |
|  | 0x4 | 200μs to 400μs |
|  | 0x5 | 300μs to 600μs |
|  | 0x6 | 400μs to 800μs |
|  | 0x7 | 500μs to 1000μs |

(Note) Detection time has the above-mentioned variation within the limits

BCLK stop detection time
    Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| BCLK   0x08 [ 6:4 ] | 0x0 | 10μs to 20μs |
|  | 0x1 | 20μs to 40μs |
|  | 0x2 | 50μs to 100μs |
|  | 0x3 | 100μs to 200μs |
|  | 0x4 | 200μs to 400μs |
|  | 0x5 | 300μs to 600μs |
|  | 0x6 | 400μs to 800μs |
|  | 0x7 | 500μs to 1000μs |

(Note) Detection time has the above-mentioned variation within the limits.

Stop detection flag read back register (Read Only)

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x09 [ 5 ] | 0x0 | Normal |
| | 0x1 | Detection of LRCLK stop flag |
| 0x09 [ 4 ] | 0x0 | Normal |
| | 0x1 | Detection of BCLK stop flag |

Stop detection flag clear register (Write Only)

| Select Address | Explanation of Operation |
|---|---|
| 0x09 [ 1 ] | LRCLK stop detection flag is cleared by writing 0x1. |
| 0x09 [ 0 ] | BCLK stop detection flag is cleared by writing 0x1. |

(Note) When using Auto recovery from clock error function(P.62), the above-mentioned flag is cleared automatically.

LRCLK stop flag valid or invalid selection
    Default = 0x1 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x07 [ 3 ] | 0x0 | Valid |
| | 0x1 | Invalid |

BCLK stop flag valid or invalid selection
    Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x08 [ 7 ] | 0x0 | Valid |
| | 0x1 | Invalid |

5-2. Out of sync Detection

As for out of sync detecting function, it detects as out of sync error when it counts between the rising edges of LRCLK with internal clock (49.152MHz), and it shifts more than the definite value, and whether PLL is normally locked is judged.

| Input Sampling Frequency | 32kHz, 44.1kHz, 48kHz |
|---|---|
| Count value (Start of counting from 0) | 1023 |

As for the detection result, reading from the register is possible. As a result of the judgment as out of sync once, it is not cleared until a clear command is transmitted even if the state of the clock returns normally. Moreover, out of sync count setting is also possible, and if the error is detected more than the number of times set by the command, the flag (0x06[1]) becomes "0x1".

Out of sync flag reading register (Read Only)

| Select Address | Value | Explanation of operation |
|---|---|---|
| 0x06 [ 1 ] | 0x0 | Normal |
| | 0x1 | Synchronous blank detect |

Out of sync flag clear register (Write Only)

| Select Address | Explanation of operation |
|---|---|
| 0x06 [ 0 ] | When "0x1" is written, the out of sync flag is cleared. |

(Note) When using Auto recovery from clock error function(P.62), the above-mentioned flag is cleared automatically.

Out of sync count setting
    Default = 0x2

| Select Address | Explanation of operation |
|---|---|
| 0x06 [ 6:4 ] | Set more than 0x1 (Set 0x1 to 0x7). When the actual detection count of out of sync exceeds the setting, Select Address "0x07[1]" becomes "0x1". |

5-3. BCLK High or Low Speed Detection function

BCLK high or low speed detection function counts the period of BCLK rising edge by using internal clock (12MHz to 25MHz), and if the count value go beyond a constant value, it judge that abnormal speed of clock is occurred such as BCLK speed become high or low.
When using a BCLK speed detection, speed failure detection can be more correctly performed by making a command set reflect about an input sampling rate.
When you validate sampling rate setting, be sure to set up the sampling rate inputted with 0x0C [1:0] command. A high speed and the low speed detection flag can set up validity and the invalidity respectively. If valid flag is detected, output is muted(immediate mute) .

Valid or invalid frequency value setting up by 0x0C[1:0] command.
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0A [ 3 ] | 0x0 | Valid |
| | 0x1 | Invalid |

Setting of input sampling rate
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0C [ 1:0 ] | 0x0 | 48kHz |
| | 0x1 | 44.1kHz |
| | 0x2 | 32kHz |

The setting of constraints of a high speed or a low speed detection condition
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0A [ 2 ] | 0x0 | ±10% |

It can check detection result by reading back.
The result judged that is once unusual is not cleared until it transmits a clear command, even if the condition of a clock returns to normal. It is possible to set the number of judging count of high speed flag detection and low speed flag detection by the command. If the error more than the predetermined number is detected, the flag (0x0A[1], 0x0B[1]) becomes "0x1".

BCLK high speed flag (Read Only)

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0A [ 1 ] | 0x0 | Normal |
| | 0x1 | High speed detection flag |

BCLK low speed flag (Read Only)

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0B [ 1 ] | 0x0 | Normal |
| | 0x1 | Low speed detection flag |

High speed detection clears register (Write Only)

| Select Address | Explanation of Operation |
|---|---|
| 0x0A [ 0 ] | If "0x1" writes in, a high speed detection flag will be cleared. |

(Note) When using Auto recovery from clock error function(P.62), the above-mentioned flag is cleared automatically.

Low speed detection clear register (Write Only)

| Select Address | Explanation of Operation |
|---|---|
| 0x0B [ 0 ] | If "0x1" is written, a low speed detection flag will be cleared. |

(Note) When using Auto recovery from clock error function(P.62), the above-mentioned flag is cleared automatically.

A constraint of the count of judging with high speed flag detection
Default = 0x2

| Select Address | Explanation of Operation |
|---|---|
| 0x0A [ 6:4 ] | Set over 0x1. (0x1-0x7 are set up) it become "0x0A[1]=0x1" if the BCLK high speed condition more than the count of setting up is detected continuously. |

A constraint of the count of judging with low speed flag detection
Default = 0x2

| Select Address | Explanation of Operation |
|---|---|
| 0x0B [ 6:4 ] | Set over 0x1. (0x1-0x7 are set up) it become "0x0B[1]=0x1" if the BCLK low speed condition more than the count of setting up is detected continuously. |

High speed detection flag valid or invalid
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0A [ 7 ] | 0x0 | Valid |
|  | 0x1 | Invalid |

Low speed detection flag valid or invalid
Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0B [ 7 ] | 0x0 | Valid |
|  | 0x1 | Invalid |

The frequency range of BCLK by which high speed detection or low speed detection is carried out is as follows.

| Setting1 | Setting2 | Low speed detection lowest frequency (MHz) | High speed detection highest frequency (MHz) |
|---|---|---|---|
| 64fs   BCLK(0x03[ 5:4 ]=0x0) | 48kHz(0x0C[1:0]=0x0) | 1.28 | 7.13 |
|  | 44.1kHz(0x0C[1:0]=0x1) | 1.21 | 6.55 |
|  | 32kHz(0x0C[1:0]=0x2) | 0.88 | 4.76 |
| 48fs   BCLK(0x03[ 5:4 ]=0x1) | 48kHz(0x0C[1:0]=0x0) | 0.96 | 5.35 |
|  | 44.1kHz(0x0C[1:0]=0x1) | 0.91 | 4.92 |
|  | 32kHz(0x0C[1:0]=0x2) | 0.66 | 3.57 |
| 32fs   BCLK(0x03[ 5:4 ]=0x2) | 48kHz(0x0C[1:0]=0x0) | 0.64 | 3.56 |
|  | 44.1kHz(0x0C[1:0]=0x1) | 0.60 | 3.28 |
|  | 32kHz(0x0C[1:0]=0x2) | 0.44 | 2.38 |

## 6. Auto Recovery of Clock Error Function

Establishment of Clock stop detection flag or BCLK high speed detection flag or BCLK low speed detection flag makes PWM output signal mute(Immediate mute).
In that case, if the Auto Recovery of Clock Error Function is enabled, when it returns to a normal input, a mute condition will be cancelled automatically.
When Auto Recovery of Clock Error Function is cancelled, it is necessary to control a series of operations called a mute-on and flag clear command transmission, an internal RAM data clear and mute release from an external microcomputer.
Since it is invalid immediately after a wake-up, 0x0D[6] =0x1 is set up before mute release, and it is recommended to enable this function.

Valid or invalid auto recover from clock error
  Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x0D [ 6 ] | 0x0 | Invalid |
| | 0x1 | Valid |

Each error flag can be read from the following addresses. When 0x1 is read from a read address, the error flag establish. Moreover, a flag is not cleared until it writes 0x0 in the target address, even if error status will be canceled, once a flag leaves.

Error flag read register

| Select Address | Explanation of Operation |
|---|---|
| 0x0E [ 6 ] | Synchronous error flag |
| 0x0E [ 4 ] | LRCLK stop flag |
| 0x0E [ 3 ] | BCLK stop flag |
| 0x0E [ 2 ] | BCLK high speed detection flag |
| 0x0E [ 1 ] | BCLK low speed detection flag |

## 7. The Wake-up Procedure of Power-up

It has to start power-up in the following procedures.
"0x**=0x**" means writing data to register. (For example) "0x10=0x00" It means writing data "0x00" to select address "0x10".

1. Power-up (VCCP1, VCCP2, DVDD)
    Input BCLK and LRCLK
    Wait over 10ms
    Input stable BCLK and LRCLK in the specification
    Wait over 1ms
2. Release reset (RSTX=high)
    Wait over 1ms
3. 0x0C=0x00 : Sampling rate setting
    (Set 48kHz: 0x00, 44.1kHz: 0x01, 32kHz: 0x02 to 0x0C address)
4. 0xE9=0x10 : Clock initialization
    Wait over 100ms
5. 0x01=0x00 : Set RAM clear OFF
6. 0x0D=0x40 : Valid auto recover from clock error
7. 0x0E=0x00 : Clear error flag
8. 0x92=0x1D : PWM setting1
9. 0x93=0x1B : PWM setting2
10. 0x94=0x0F : PWM setting3
11. 0x95=0x11 : PWM setting4
12. 0x90=0x40 : PWM setting5
13. 0xF4=0x14 : Protect function initialization
14. 0xF3=0x03 : Driver Gain setting (0x03: 26dB, 0x0B: 32dB)
15. 0xF2=0x02 : Stereo application setting (0x02:Stereo, 0x0A:Monaural)
16. 0xF8=0x01 : 0xF4, 0xF3, 0xF2 setting value is fixed
    Wait over 10ms
17. Set up DSP function such as volume, BQ, DRC, and Pre-Scaler etc.
18. MUTEX=high : Release mute

    * Order from 8 to 12 and 17 can be interchanged.

### 8. The Operating Procedure in a Status with an Unstable Clock

In the period there is the possibility that inputted $I^2S$ ,BCLK, LRCLK and SDATA, may become unstable, set MUTEX=low to mute output.

Figure 68. The operating procedure in a status with an unstable clock

* When clock stop was detected, mute release procedure will follow the clock stop error release sequence.

### 9. I²S Data Output Select

Capable of output I²S format digital audio data from SDATAO (pin12).
That signal synchronizes to inputted LRCK and BCK signal.
And enable to select output SDATA signal as shown below.
The point of selected data is shown below diagram.
Whatever • output is selected, hard clip is processed.

SDATAO output select
   Default = 0x0 *Blue square means initial value.

| Select Address | Value | Explanation of Operation |
|---|---|---|
| 0x78 [ 6:4 ] | 0x0 | DSP output (point1) |
| | 0x1 | DSP input (point2) |
| | 0x2 | Pre-Scaler output (point3) |
| | 0x3 | Mixer output (point4) |
| | 0x4 | 12Band BQ output (point5) |
| | 0x5 | Fine master volume output (point6) |
| | 0x6 | Don't use |
| | 0x7 | Fine Post-Scaler output (point7) |

Figure 69

## Register Map

| Address | Initial Value | Recommended value | Description | Function |
|---|---|---|---|---|
| 0x01 | 0xE0 | 0x00 [(Note 21)] | RAM clear | RAM clear setting |
| 0x02 | 0x00 | 0x00 | Bypass | Select bypass blocks |
| 0x03 | 0x02 | 0x02 | Digital audio input 1 | I$^2$S input format setting |
| 0x06 | 0x20 | 0x20 | Synchronous error 2 | Synchronous error setting |
| 0x07 | 0x8A | 0x8A | LRCLK,BCLK stop detection 1 | LRCLK stop detection setting |
| 0x08 | 0x00 | 0x00 | LRCLK,BCLK stop detection 2 | BCLK stop detection setting |
| 0x09 | Read/Write Only | - | LRCLK,BCLK stop detection 3 | Read/Clear stop detection |
| 0x0A | 0x20 | 0x20 | BCLK Measurement of velocity 1 | BCLK fast detection setting |
| 0x0B | 0x20 | 0x20 | BCLK Measurement of velocity 2 | BCLK slow detection setting |
| 0x0C | 0x00 | 0x00 (48kHz sampling) [(Note 21)] | Sampling frequency setting | Sampling frequency setting |

| | 1 | C27 | 10μF / 16V / B(±10%) |

Caution1: If the impedance characteristics of the speakers at high-frequency range increase rapidly, the IC might not have stable operation in the resonance frequency range of the LC filter. Therefore, consider adding damping-circuit, etc., depending on the impedance of the speaker.

Caution2: Though this IC has a short protection function, when short to VCC or GND after the LC filter, over-current occurs during short protection function operation. Be careful about over/undershoot which exceeds the maximum standard ratings because back electromotive force of the inductor will occur which sometimes leads to IC destruction.
The Inductor must be use to the coil with large margin of rated DC current (saturation current). When the short-circuit of the speaker output (after the LC filter) to VCC or GND occurs when the coil with small rated DC current is used, IC destruction might be caused. Because the coil causes the magnetic saturation behavior, it instantaneously passes the heavy-current to IC.

Caution3: Overshoot of output PWM differs according to the board or coupling capacitor of Vcc, and etc. Check to ensure that it is lower than absolute maximum ratings.
If it exceeds the absolute maximum ratings, snubber circuit must need to be added.

Caution4: When it is used at $V_{CCP1}$,$V_{CCP2}$>22V, snubber circuit must need to be added, and must change LC filter value to suppress the influence of the LCR resonance.

Caution5: This circuit constant is value with ROHM evaluation board, and adjustment of the constant may be necessary for the application board. Must carry out enough evaluations.

*Register setting of 0xF2=0x0A and 0xF8=0x01 is necessary at the time of start-up (in state of MUTEX=low).
 (Refer to "Monaural output setting".)

Caution1:   If the impedance characteristics of the speakers at high-frequency range increase rapidly, the IC might not have stable operation in the resonance frequency range of the LC filter. Therefore, consider adding damping-circuit, etc., depending on the impedance of the speaker.
Caution2:   Though this IC has a short protection function, when short to VCC or GND after the LC filter, over-current occurs during short protection function operation. Be careful about over/undershoot which exceeds the maximum standard ratings because back electromotive force of the inductor will occur which sometimes leads to IC destruction.
The Inductor must be use to the coil with large margin of rated DC current (saturation current). When the short-circuit of the speaker output (after the LC filter) to VCC or GND occurs when the coil with small rated DC current is used, IC destruction might be caused. Because the coil causes the magnetic saturation behavior, it instantaneously passes the heavy-current to IC.
Caution3:   Overshoot of output PWM differs according to the board or coupling capacitor of VCC, and etc. Check to ensure that it is lower than absolute maximum ratings.
If it exceeds the absolute maximum ratings, snubber circuit must need to be added.
Caution4:   This circuit constant is value with ROHM evaluation board, and adjustment of the constant may be necessary for the application board. Must carry out enough evaluations.

**Selection of Components Externally Connected**

1) Output LC Filter Circuit

An output filter is required to eliminate radio-frequency components exceeding the audio-frequency region supplied to a load (speaker). Because this IC uses sampling frequency 384kHz ($f_S$=48kHz) in the output PWM signals, the high-frequency components must be appropriately removed.
This section takes an example of an LC type LPF shown below, in which coil L and capacitor $C_g$ compose a differential filter with an attenuation property of -12dB/oct.

Figure 73. Output LC filter

Following presents output LC filter constants with typical load impedances.

| $R_L$ | L | $C_g$ | Note |
|---|---|---|---|
| 4Ω | 10µH | 1µF | $V_{CCP1}$,$V_{CCP2}$≤14V |
| 6Ω | 10µH | 0.68µF | $V_{CCP1}$,$V_{CCP2}$≤22V |
| | 15µH | 0.47µF | $V_{CCP1}$,$V_{CCP2}$>22V |
| 8Ω | 10µH | 0.47µF | $V_{CCP1}$,$V_{CCP2}$≤22V |
| | 15µH | 0.47µF | $V_{CCP1}$,$V_{CCP2}$>22V |

Use coils with a low direct-current resistance and a sufficient margin of allowable currents. In addition, select a closed magnetic circuit type product in normal cases to prevent unwanted emission. A high direct-current resistance causes power losses.
When the short-circuit of the speaker output (After the LC filter) to VCC or GND occurs when the coil with small rated DC current is used, IC destruction might be caused. Because the coil causes the magnetic saturation behavior, it instantaneously passes the heavy-current to IC.
When using at $V_{CCP1}$,$V_{CCP2}$>22V, the coil of the rated DC current: 7.2A or more will be recommended.
And, $f_{CL}$ (LC resonance frequency) of the LC filter should be lowered and decrease the influence of LC resonance.

Use capacitors with low equivalent series resistance and good impedance characteristics at high frequency ranges.
Also, select the parts with the margin of the ratings enough.

2) The Value of the LC Filter Circuit Computed Equation

The output LC filter circuit of BM28723MUV is as it is shown in Figure 74. The LC filter circuit of Figure 74 is thought to substitute it like Figure 75 on the occasion of the computation of the value of the LC filter circuit.

Figure 74. Output LC filter 1

Figure 75. Output LC filter 2

www.rohm.com
© 2016 ROHM Co., Ltd. All rights reserved.
TSZ22111 • 15 • 001
71/79
**TSZ02201-0C1C0E900290-1-2**
**01.Dec.2016 Rev.001**

The transfer function H(s) of the LC filter circuit of Figure 75. becomes the following.

$$H(s) = \frac{\dfrac{1}{LC_g}}{s^2 + \dfrac{1}{C_g R}s + \dfrac{1}{LC_g}} = \frac{\omega^2}{s^2 + \dfrac{\omega}{Q}s + \omega^2}$$

The $\omega$ and Q become the followings here.

$$\omega^2 = \frac{1}{LC_g} \qquad \omega = 2\pi f_{CL} \qquad f_{CL} = \frac{1}{2\pi\sqrt{LC_g}}$$

$$Q = R\sqrt{\frac{C_g}{L}} = \frac{1}{2}R_L\sqrt{\frac{C_g}{L}}$$

Therefore, L and $C_g$ become the followings.

$$L = \frac{1}{\omega^2 C_g} = \frac{R_L}{4\pi f_{CL}Q} \qquad C_g = \frac{Q}{\omega R} = \frac{Q}{\pi f_{CL}R_L}$$

The $R_L$ and L should be made known, and $f_{CL}$ is set up, and $C_g$ is decided.

3) The Settlement of the Inductance Value of the Coil

A standard for selection of the L value of a coil to use is to take the following consideration except for the factor such as a low cost, miniaturization and thin.

① When the inductance value was made small
(1) Circuit electric currents increase without a signal. Efficiency in the low output power gets bad.
(2) Direct current resistance value of the coil becomes small.
   Therefore maximum output power becomes bigger.
   Rated DC current and Temperature rise current of the coil become high.

② When the inductance value was made large
(1) Circuit electric current is decrease without a signal. Efficiency in the low output power improves.
(2) Direct current resistance value of the coil becomes big.
   Therefore maximum output power becomes smaller.
   Rated DC current and Temperature rise current of the coil becomes low.

4) Snubber Circuit Constant

When overshoot of PWM Output exceeds absolute maximum rating, and when $V_{CCP1}$,$V_{CCP2}$>22V, or when overshoot of PWM output negatively affects EMI, or when ringing deteriorates the audio characteristic of the PWM output, snubber circuit is used as shown below.

① Measure the ringing resonance frequency "$f_1$" of PWM output waveform (when rising) by using low capacitance Probe (e.g. FET probe) at the OUT terminal. (Figure 76)
Shorten GND lead of FET probe and monitor as near as possible to output pin.

② Measure the resonance frequency "$f_2$" of the ringing as the snubber-circuit $R_{snb}$ value equals 0Ω
(capacitor is connected to GND)
Adjust the value of the capacitor "C" until it becomes half of $f_1$($2f_2=f_1$).
The value of "C" that becomes ($2f_2=f_1$) is 3 times of the parasitic capacity "$C_p$" that a ringing is formed. ($C=3C_p$)

③ Parasitic inductance "$L_p$" is calculated using the next formula.

$$L_p = \frac{1}{(2\pi f_1)^2 C_p}$$

④ The characteristics impedance Z of resonance is calculated from the parasitic capacity "$C_p$" and the parasitic inductance $L_p$ using the next formula.

$$Z = \sqrt{\frac{L_p}{C_p}}$$

⑤ Set snubber circuit "$R_{snb}$" same as the character impedance "Z".
Set snubber circuit "$C_{snb}$" 4 to 10 times of the parasitic capacity "$C_p$".
If "$C_{snb}$" value is set large, switching current will possibly increase.
Therefore, please decide it by the trade-off with the characteristic.

Figure 76. PWM Output waveform
（Measure of spike resonance frequency）

Figure 77. Snubber schematic

Following presents Snubber filter constants with the recommendation value at 22V<$V_{CCP1}$,$V_{CCP2}$≤24V, $R_L$=8Ω, Po=10W+10W, ROHM 4 layer board[Note 11].

| $C_{snb}$ | $R_{snb}$ |
|---|---|
| 680pF 50V CH(±5%) | 5.6Ω 1/4W J(±5%) |

Following presents Snubber filter constants with the recommendation value at $V_{CCP1}$,$V_{CCP2}$≤22V, $R_L$=8Ω, Po=10W+10W, ROHM 4 layer board[Note 11].

| $C_{snb}$ | $R_{snb}$ |
|---|---|
| 470pF 50V CH(±5%) | 0Ω or 5.6Ω 1/8W J(±5%) |

(Note 11) 100mm×100mm×1.6mm FR4, 4-layer glass epoxy board, Cu Thickness 35μm/70μm/70μm/35μm, For Application Evaluation Board

**Operating Condition with the Application Component**

| Parameter | Parts No. | Limit | | | Unit | Conditions |
|---|---|---|---|---|---|---|
| | | Min | Typ | Max | | |
| Coupling capacitor for Power supply | C17, C24 | 1[Note 22] | 10 | - | μF | B characteristics Ceramic type capacitor recommended |
| Capacitor for REG_G | C27 | 1[Note 22] | 10 | 13.5[Note 24] | μF | B characteristics, 16V Ceramic type capacitor recommended |
| Capacitor for REG15 | C7 | 0.4[Note 22] | 1.0 | 1.35[Note 24] | μF | B characteristics, 10V Ceramic type capacitor recommended |
| Capacitor for BSP | C15, C19, C22, C26 | 2.0[Note 22] [Note 23] | 3.3 | 4.5[Note 24] | μF | B characteristics, 16V Ceramic type capacitor recommended |
| | | 2.0[Note 22] [Note 23] | 4.7 | 6.3[Note 24] [Note 25] | μF | B characteristics, 16V Ceramic type capacitor recommended |

(Note 22) Should use the capacity of the capacitor not to be less than a minimum in consideration of temperature characteristics and dc-bias characteristics.
(Note 23) Minimum value to guarantee Speaker output operating range(20 to 20kHz, sin wave, THD+N ≤ 10%)
(Note 24) Use it within this rating. (Capacitance±10%, Capacitance change ratio±22%)
(Note 25) Influence it at the RSTX ⇒MUTEX Wait time ($T_{WAIT}$ :Refer to P.27) at the time of the Power Supply Start-up. Use it within this rating.

## Operational Notes

1. **Reverse Connection of Power Supply**
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. **Power Supply Lines**
   Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. **Ground Voltage**
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition. However, pins that drive inductive loads (e.g. motor driver outputs, DC-DC converter outputs) may inevitably go below ground due to back EMF or electromotive force. In such cases, the user should make sure that such voltages going below ground will not cause the IC and the system to malfunction by examining carefully all relevant factors and conditions such as motor characteristics, supply voltage, operating frequency and PCB wiring to name a few.

4. **Ground Wiring Pattern**
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. **Thermal Consideration**
   Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the maximum junction temperature rating.

6. **Recommended Operating Conditions**
   These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. **Inrush Current**
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. **Operation Under Strong Electromagnetic Field**
   Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. **Testing on Application Boards**
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

## Operational Notes – continued

10. **Inter-pin Short and Mounting Errors**
Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

11. **Unused Input Pins**
Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

12. **Regarding the Input Pin of the IC**
This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

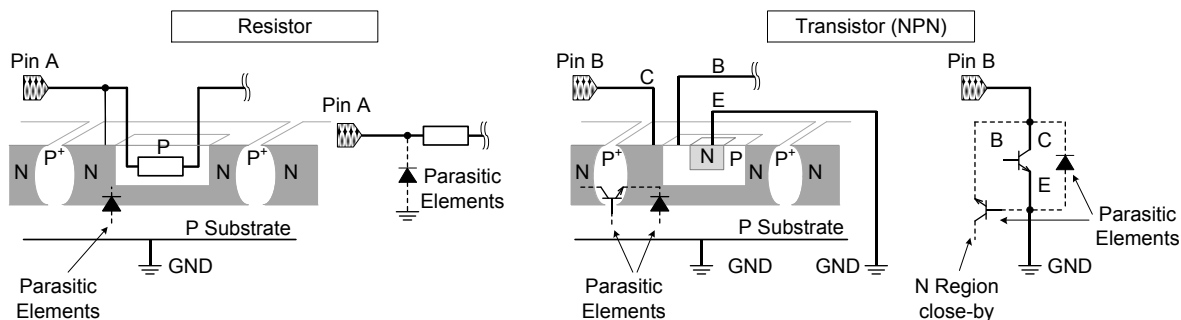

Figure 78. Example of monolithic IC structure

13. **Ceramic Capacitor**
When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

14. **Area of Safe Operation (ASO)**
Operate the IC such that the output voltage, output current, and the maximum junction temperature rating are all within the Area of Safe Operation (ASO).

15. **Thermal Shutdown Circuit(TSD)**
This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

16. **Over Current Protection Circuit (OCP)**
This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

# Notice

**Precaution on using ROHM Products**

1.  Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment [Note 1], transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

    (Note1) Medical Equipment Classification of the Specific Applications

    | JAPAN | USA | EU | CHINA |
    |---|---|---|---|
    | CLASSⅢ | CLASSⅢ | CLASSⅡb | CLASSⅢ |
    | CLASSⅣ | | CLASSⅢ | |

2.  ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
    *   [a] Installation of protection circuits or other protective devices to improve system safety
    *   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3.  Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
    *   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
    *   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
    *   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including $Cl_2$, $H_2S$, $NH_3$, $SO_2$, and $NO_2$
    *   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
    *   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
    *   [f] Sealing or coating our Products with resin or other coating materials
    *   [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
    *   [h] Use of the Products in places subject to dew condensation

4.  The Products are not subject to radiation-proof design.

5.  Please verify and confirm characteristics of the final or mounted products in using the Products.

6.  In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7.  De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8.  Confirm that operation temperature is within the specified range described in the product specification.

9.  ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

**Precaution for Mounting / Circuit board design**

1.  When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2.  In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

## Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

## Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

## Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
    [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
    [b] the temperature or humidity exceeds those recommended by ROHM
    [c] the Products are exposed to direct sunshine or condensation
    [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

## Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

## Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

## Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

## Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

## Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Pro ducts, you are requested to care fully read this document and fully understand its contents. ROHM shall n ot be in an y way responsible or liabl e for fa ilure, malfunction or acci dent arising from the use of a ny ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this docume nt is current as of the issuing date and subj ect to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the la test information with a ROHM sale s representative.

3. The information contained in this doc ument is provi ded on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate an d/or error-free. ROHM shall not be in an y way responsible or liable for an y damages, expenses or losses incurred b y you or third parties resulting from inaccur acy or errors of or concerning such information.
