

Description

The BP6903 is a high voltage, high speed half-bridge pre-driver for power MOSFET and IGBT. It has inputs for both high side and low side, and two output channels with internal dead time to avoid cross-conduction.

The input logic level is compatible with 3.3V/5V/15V signal. The floating high side channel can drive an N-channel power MOSFET or IGBT up to 600V.

Features

- Floating channel operation up to 600V
- Robust at negative transient voltage
- Gate drive supply range from 10V to 20V
- 3.3V, 5V and 15V input logic input compatible
- Reverse input for low side
- UVLO for both high side and low side
- Built-in dead time
- Available in SOP8 package

Pin Definition

Pin No.	Name	Description
1	VCC	Low side and logic supply voltage
2	HIN	Logic input for high side, in phase with HO
3	LINb	Logic input for low side, out of phase with LO
4	COM	Logic ground and low side driver return
5	LO	Low side driver output
6	VS	High side driver return
7	HO	High side driver output
8	VB	High side floating supply

Absolute Maximum Ratings (note 1)

Symbol	Parameters	Min.	Max.	Unit
V _B	High side floating supply voltage	-0.3	625	V
V _S	High side offset voltage	V _B - 25	V _B + 0.3	V
V _{HO}	High side driver output voltage	V _S - 0.3	V _B + 0.3	V
V _{CC}	Low side and logic supply voltage	-0.3	25	V
V _{LO}	Low side driver output voltage	-0.3	V _{CC} + 0.3	V
HIN/ LINb	Logic input voltage	-0.3	V _{CC} + 0.3	V
dV _s /dt	Allowable offset voltage slew rate	--	50	V/ns
P _{DMAX}	Package power dissipation (note 2)	--	0.625	W
θ _{JA}	Thermal resistance, junction to ambient	--	200	°C/W
T _J	Junction temperature	-40	150	°C
T _{STG}	Storage temperature	-55	150	°C
	ESD (note 3)		2	kV

Note 1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. Under "recommended operating conditions" the device operation is assured, but some particular parameter may not be achieved. The electrical characteristics table defines the operation range of the device, the electrical characteristics is assured on DC and AC voltage by test program. For the parameters without minimum and maximum value in the EC table, the typical value defines the operation range, the accuracy is not guaranteed by spec.

Note 2: The maximum power dissipation decrease if temperature rise, it is decided by T_{JMAX}, θ_{JA}, and environment temperature (T_A). The maximum power dissipation is the lower one between P_{DMAX} = (T_{JMAX} - T_A) / θ_{JA} and the number listed in the maximum table.

Note 3: Human Body mode, 100pF capacitor discharge on 1.5k Ω resistor.
