

CA-IS1311 5-kV_{RMS} Reinforced Isolated Amplifier for Voltage Sensing

1 Key Features

- Input Voltage Range: -0.1 V to 2 V
- High Input Impedance: $1\text{ G}\Omega$ (typ)
- Fixed Initial Gain: 1
- Low Input Offset and Drift:
 $\pm 1.5\text{ mV}$ (max) at 25°C , $\pm 15\text{ }\mu\text{V}/^\circ\text{C}$ (max)
- Low Gain Error and Drift:
 $\pm 0.3\%$ (max) at 25°C , $\pm 40\text{ ppm}/^\circ\text{C}$ (max)
- 3.3-V or 5-V Operation for Both High- and Low-Side
- Wide Operating Temperature Range: -40°C to 125°C
- High CMTI: $\pm 150\text{ kV}/\mu\text{s}$ (typ, CA-IS1311BG)
- Safety-Related Certifications
 - VDE 0884-17 isolation certification
 - UL according to UL1577
 - IEC 61010-1:2010+A1 certifications
- >40-year Life at Rated Working Voltage

2 Applications

- Industrial Motor Controls and Drives
- Isolated Switch Mode Supplies
- Uninterruptible Power Supplies

3 Description

The CA-IS1311 devices are high-precision reinforced isolated amplifiers and optimized for voltage sensing. Low offset and gain error and drift guarantee that measuring accuracy is maintained over the entire operating temperature range.

The CA-IS1311 devices utilize silicon oxide (SiO_2) isolation barriers and support up to 5-kV_{RMS} galvanic isolation per UL 1577. This technology separates high- and low-voltage domain to protect lower-voltage parts from damage and provides low emissions as well as strong anti-interference capability from magnetic changes. The high common-mode transient immunity (CMTI) means that the CA-IS1311

devices transmit correct signals through isolation barriers and are suitable for industrial motor controls and drives which require high-voltage and high-power switching. The internal missing or undervoltage lockout (UVLO) of high-side supply voltage detection functions contribute to fault diagnostics and system safety.

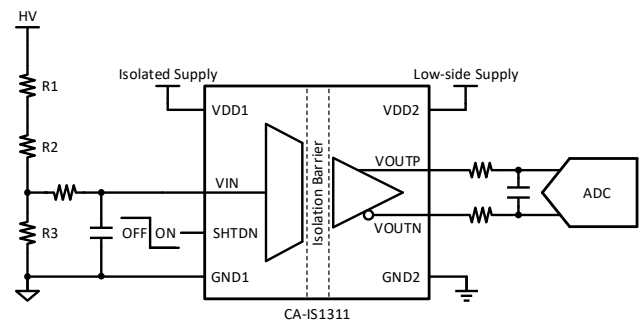

The input of CA-IS1311 is high-impedance, making it suitable for applications where the measured signal sources have high output resistance (such as high-voltage resistive dividers). The CA-IS1311 devices have shutdown mode, which could shut down the high-side circuit by pulling up SHTDN pin to save power.

The CA-IS1311 devices are packaged in wide body, 8-pin SOIC packages and specified over the extended industrial temperature range of -40°C to 125°C .

6 Pin Descriptions and Functions

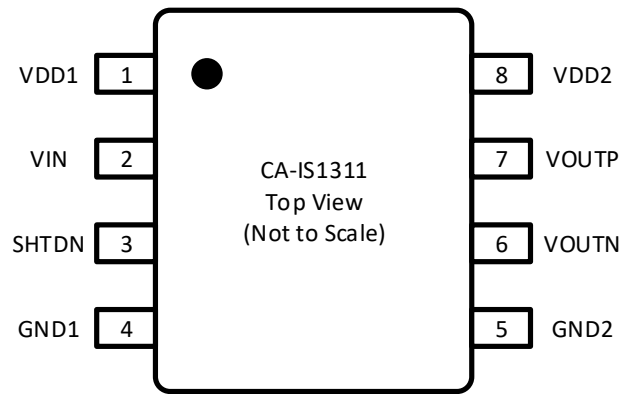

Figure 6-1 CA-IS1311 Top View

Table 6-1 CA-IS1311 Pin Description and Functions

NAME	PIN NUMBER	TYPE	DESCRIPTION
VDD1	1	Power	High-side power supply, 3 V to 5.5 V
VIN	2	Input	Analog input
SHTDN	3	Input	Shutdown-mode control input, active high, with internal pull-up
GND1	4	Ground	High-side ground
GND2	5	Ground	Low-side ground
VOUTN	6	Output	Inverting analog output
VOU TP	7	Output	Noninverting analog output
VDD2	8	Power	Low-side power supply, 3 V to 5.5 V

7 Specifications

7.1 Absolute Maximum Ratings¹

PARAMETER		MIN	MAX	UNIT
VDD1, VDD2	Supply voltage ²	-0.5	6.5	V
VIN	Analog input voltage	GND1 - 6	VDD1 + 0.5 ³	V
SHTDN	Shutdown mode control input voltage	GND1 - 0.5	VDD1 + 0.5 ³	V
VOU _{TP} , VOU _{TN}	Analog output voltage	GND2 - 0.5	VDD2 + 0.5 ³	V
I _{IN}	Input current to any pin except supply pins	-10	10	mA
T _J	Junction Temperature		150	°C
T _{STG}	Storage Temperature	-65	150	°C

NOTE:

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- Maximum voltage must not exceed 6.5 V.

7.2 ESD Ratings

		VALUE	UNIT
V _{ESD}	Electrostatic discharge		
	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins	±4000	V
Charged device model (CDM), per JEDEC specification JESD22-C101, all pins	±2000		

7.3 Recommended Operating Conditions

PARAMETER		MIN	NOM	MAX	UNIT
VDD1	High-side supply voltage, with respect to GND1	3.0	5.0	5.5	V
VDD2	Low-side supply voltage, with respect to GND2	3.0	3.3	5.5	V
V _{Clipping}	Maximum input voltage before clipping output		2.516		V
V _{FSR}	Specified linear full-scale input range	-0.1		2	V
	Absolute input voltage without damage	-2		VDD1	V
T _A	Ambient Temperature	-40		125	°C

7.4 Thermal Information

THERMAL METRIC		VALUE	UNIT
R _{θJA}	Junction-to-ambient thermal resistance	110.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	51.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	66.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	16.0	°C/W
ψ _{JB}	Junction-to-board characterization parameter	64.5	°C/W
R _{θJC(bottom)}	Junction-to-case (bottom) thermal resistance	NA	°C/W

7.5 Power Ratings

PARAMETER		TEST CONDITIONS	VALUE	UNIT
P _D	Maximum power dissipation for both sides	VDD1 = VDD2 = 5.5 V	118.25	mW
		VDD1 = VDD2 = 3.6 V	69.12	
P _{D1}	Maximum power dissipation for high-side	VDD1 = 5.5 V	74.25	mW
		VDD1 = 3.6 V	43.20	
P _{D2}	Maximum power dissipation for low-side	VDD2 = 5.5 V	44.00	mW
		VDD2 = 3.6 V	25.92

		V _{IO} = 500 V, 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
UL 1577				
V _{ISO}	Maximum withstanding isolation voltage	V _{TEST} = V _{ISO} , t = 60 s (qualification), V _{TEST} = 1.2 × V _{ISO} , t = 1 s (100% production)	5000	V _{RMS}

NOTE:

- Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- This coupler is suitable for safe electrical insulation only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- Apparent charge is electrical discharge caused by a partial discharge (pd).
- All pins on each side of the barrier tied together creating a two-terminal device.

V_{IH}	Logic high-level input voltage			$0.7 \times V_{DD1}$		$V_{DD1} + 0.3$	V
V_{IL}	Logic low-level input voltage			-0.3		$0.3 \times V_{DD1}$	V
TIMING							
t_r	Rise time of V_{OUT} (10% – 90%)	$V_{IN} = 0\text{ V}$ to 2 V step; <i>See Figure 8-2</i>			1.2		μs

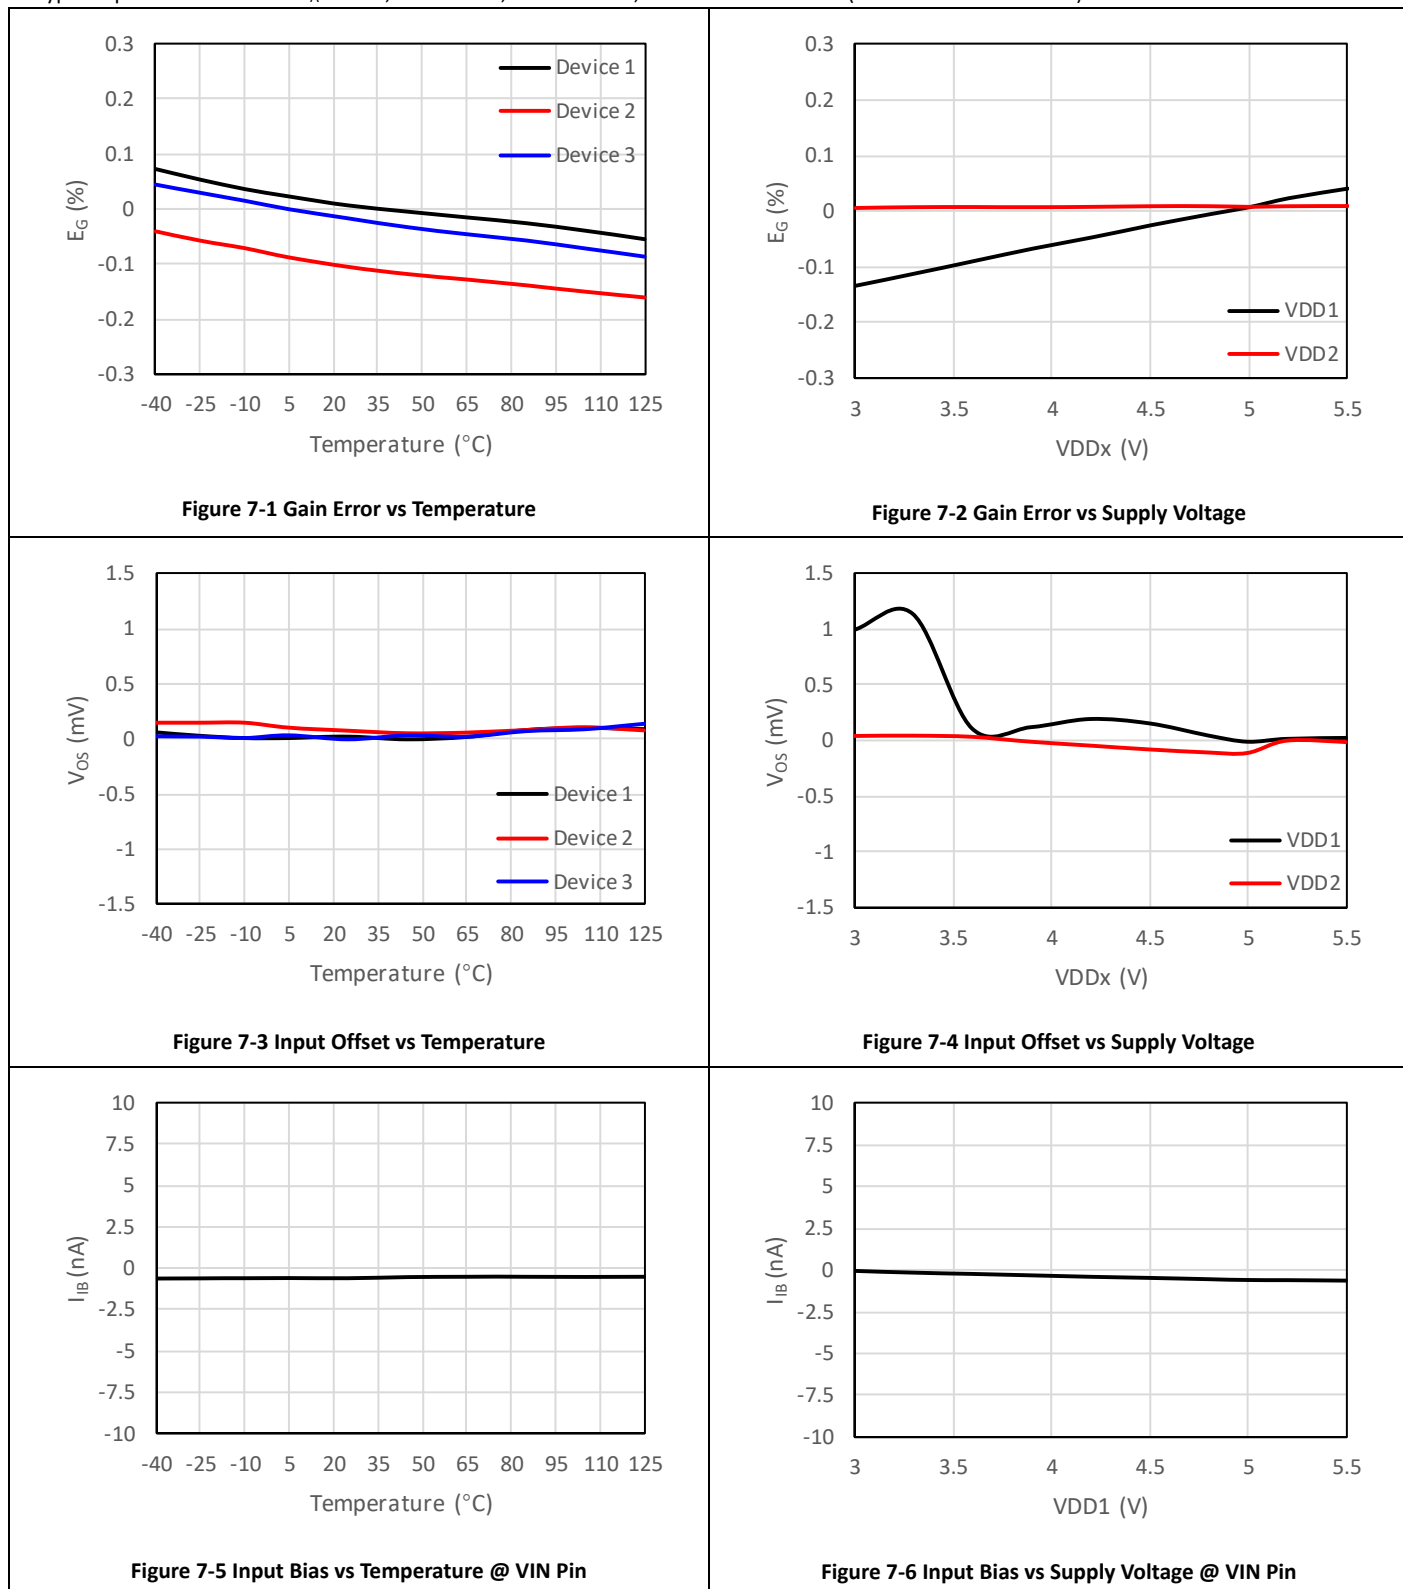

t_f	Fall time of VOUT (90% – 10%)	VIN = 2 V to 0 V step; See Figure 8-2	1.2		μs
t_{PD}	VIN to VOUT signal delay (50% – 50%)	Output unfiltered; See Figure 8-3	1.5	2.1	μs
t_{AS}	Analog settling time	VDD1 = 0 to 3 V step and $3.0\text{ V} \leq \text{VDD2}$, to VOUT valid (0.1% settling)	180	350	μs
t_{EN}	Device enable time	SHTDN high to low, $t_f < 10\text{ ns}$; See Figure 8-4	180	350	μs
t_{SHTDN}	Device shutdown time	SHTDN low to high, $t_r < 10\text{ ns}$; See Figure 8-4	1.6	5	μs

NOTE:

1. The typical value is at VDD1 = 3.3 V.
2. The gain is defined as the slope of the optimum line derived by the method of least squares between differential input voltage (VINP – VINN) and differential output voltage (VOUTP – VOUTN) over the specified input range.
3. This parameter is output referred.

7.9 Typical Characteristics

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, $V_{DD2} = 3.3\text{ V}$, $SHTDN = GND1 = 0\text{ V}$ (unless otherwise noted).

9 Detailed Description

9.1 System Overview

The CA-IS1311 devices are high-precision reinforced isolated amplifiers designed for voltage sensing. The functional block diagram of this device is shown in Figure 9-1. At high side, the high input-impedance buffer drives a 2nd-order Sigma-Delta ($\Sigma\Delta$) modulator. This modulator converts the analog signal to a digital bitstream. For transmission across the SiO₂-based isolation barrier, the digital stream is further modulated with a high-frequency carrier using a simple on-off keying (OOK) modulation scheme. The receiver (RX) recovers the modulated signal to the original digital bitstream at low side. After processed by a 1-bit digital-to-analog converter (DAC), the digital bitstream is sent to an active low-pass filter to produce the analog output. For synchronization of the whole chip, the clock is generated at low side and sent back to high side ensuring that all clocks come from one source.

Figure 9-1 Functional Block Diagram of CA-IS1311

9.2 Feature Description

9.2.1 Analog Input

The CA-IS1311 devices are suitable for applications where the measured signal sources have high output resistance (such as high-voltage resistive dividers) due to their high-impedance and low bias-current input.

The ESD structure of VIN pin in CA-IS1311 supports the absolute maximum analog input voltage (with respect to GND1) to range from GND1 – 6 V to VDD1 + 0.5 V. If the input voltage VIN exceeds this voltage range, the input current must be limited to 10 mA in order not to cause damage. To guarantee the long-term reliability and device performance, the analog input voltage of CA-IS1311 must be kept within the specific range.

9.2.2 Shutdown Mode

The CA-IS1311 devices have shutdown mode, which could shut down the high-side circuit by pulling up SHTDN pin to save power. The SHTDN pin is pulled up by an internal resistor and the typical value of this resistor is 100 k Ω . During normal operation, SHTDN pin should be connected to GND1 or held to logical LOW.

9.2.3 Signal Transmission Across Isolation Barrier

The CA-IS1311 devices utilize a simple on-off keying (OOK) modulation scheme to transmit the digital bitstream across the SiO₂-based isolation barrier which supports up to 5-kV_{RMS} galvanic isolation between high- and low-voltage domain. The block diagram of an isolation channel is shown in Figure 9-2. As shown in Figure 9-3, the transmitter (TX) modulates the digital bitstream with

a high-frequency carrier when the signal is HIGH while sends no signal when the signal is LOW. The receiver (RX) demodulates the signal across the isolation barrier and reproduces the digital bitstream faithfully. The isolation channel adopts fully differential capacitive-coupled structure which is insensitive to common-mode transient noises, thus the CMTI performance can be maximized. This structure and related circuitry also provide low emissions and strong anti-interference capability from magnetic changes.

Figure 9-2 Block Diagram of an Isolation Channel

Figure 9-3 Conceptual Operation Waveforms of OOK Modulation Scheme

9.2.4 Fail-Safe Output

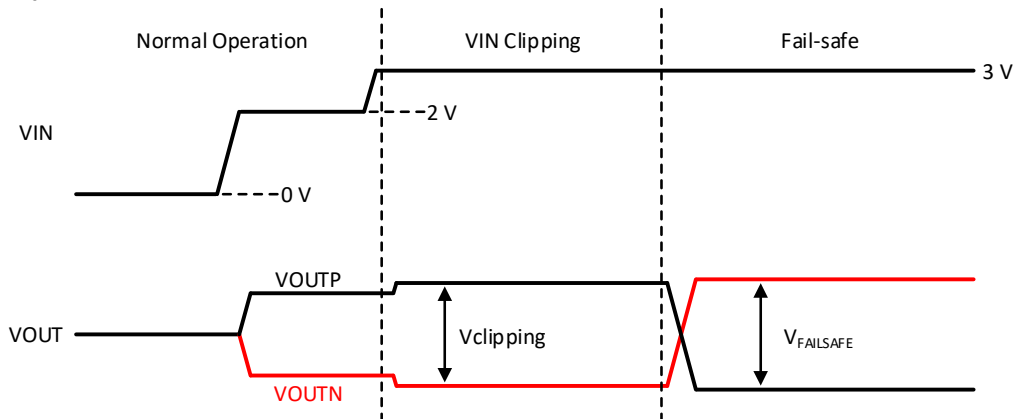

Figure 9-4 Typical Operation Waveforms in Different Conditions

The CA-IS1311 devices have fail-safe output function which is activated in three conditions:

- The high-side power supply VDD1 is missing;
- The high-side power supply VDD1 is under the undervoltage threshold VDD_{UV} ;
- The SHTDN pin is pulled high.

The fail-safe output is the most negative differential output voltage which can be distinguished from the output under normal operation or when VIN is clipping. This function contributes to fault diagnostics and system safety.

10 Application and Implementation

10.1.1 Typical Application for Voltage Sensing

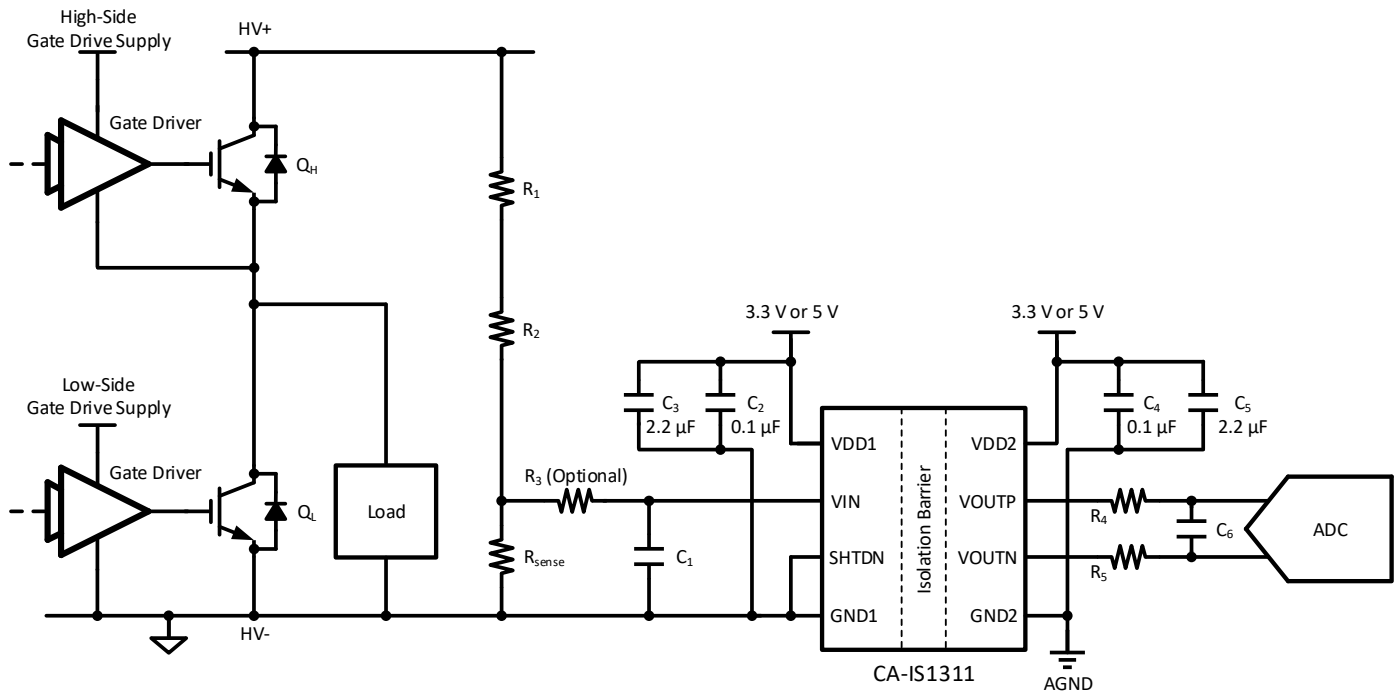

Figure 10-1 Typical Application for Voltage Sensing

The typical application for DC bus voltage sensing is shown in [Figure 10-1](#). The R_1 , R_2 and R_{sense} make up a resistor divider network, which divides the high bus voltage down to a level within the specific range.

The CA-IS1311 device is used to measure the voltage across the sense resistor (R_{sense}) and transmit it to the low-voltage side for control circuit to process. The high CMTI and low bias-current input of CA-IS1311 ensure the reliable and accurate measurement in the high-noise and high-power switching applications such as industrial motor drives. The CA-IS1311 devices support up to 5-kV_{RMS} galvanic isolation, making them suitable for these high-voltage industrial applications.

10.1.2 Choose Proper R_{sense}

Consider the following restrictions to choose proper value of the shunt resistor R_{sense} :

- The voltage drop across R_{sense} caused by the nominal measured current is within the linear differential input voltage range V_{FSR} ;
- The voltage drop across R_{sense} caused by the maximum allowed current must not exceed the maximum input voltage before clipping output $V_{Clipping}$.

10.1.3 Input Filter

A first-order passive RC low-pass filter could be placed between R_{sense} and the input to serve as anti-aliasing filter. Since R_1 and R_2 are typically large enough, R_3 is optional and a single capacitor C_1 is sufficient.

10.1.4 Power Supply Recommendations

A low-ESR decoupling capacitor of 0.1 μF (C_2) is recommended to place as close as possible to the VDD1 pin of CA-IS1311. Additional 2.2- μF capacitor (C_3) is recommended for better filtering to the high-side power-supply path.

Similarly, a 0.1- μF decoupling capacitor (C_4) followed by an additional capacitor (C_5) from 2.2 μF to 10 μF should be placed as close as to the VDD2 pin of CA-IS1311 to filter the low-side power supply path.

10.1.5 Output Filter

Another first-order passive RC low-pass filter could be placed between the outputs of CA-IS1311 and the ADC to satisfy the potential requirement for anti-aliasing filtering. The characteristics of this filter depends on the structure and sampling frequency of the ADC. Choose $R_4 = R_5 = 4.7 \text{ k}\Omega$ and $C_6 = 180 \text{ pF}$ could provide a cutoff frequency of approximately 94 kHz.

11 Package Information

11.1 8-Pin Wide Body SOIC Package

The figure below illustrates the package details and the recommended land pattern details for the CA-IS1311 reinforced isolated amplifier in an 8-pin wide-body SOIC package. The values for the dimensions are shown in millimeters.

12 Soldering Information

Profile Feature	Pb-Free Soldering
Ramp-up rate ($T_L = 217^\circ\text{C}$ to peak T_p)	3°C/s max
Time t_s of preheat temp ($T_{smin} = 150^\circ\text{C}$ to $T_{smax} = 200^\circ\text{C}$)	60~120 seconds
Time t_L to be maintained above 217°C	60~150 seconds
Peak temperature T_p	260°C
Time t_p within 5°C of actual peak temp	30 seconds max
Ramp-down rate (peak T_p to $T_L = 217^\circ\text{C}$)	6°C/s max
Time from 25°C to peak temperature T_p	8 minutes max

13 Tape and Reel Information
REEL DIMENSIONS

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal
