## 1.2MHz, BiCMOS Precision Operational Amplifiers

### Features

- Low  $V_{IO}$ 
  - CA3193A .....200 $\mu$ V (Max)
  - CA3193 .....500 $\mu$ V (Max)
- Low  $\Delta V_{IO}/\Delta T$ 
  - CA3193A .....3 $\mu$ V/ $^{\circ}$ C (Max)
  - CA3193 .....5 $\mu$ V/ $^{\circ}$ C (Max)
- Low  $I_{IO}$  and  $I_I$
- Low  $\Delta I_{IO}/\Delta T$ : CA3193 .....150pA/ $^{\circ}$ C (Max)
- Low  $\Delta I_I/\Delta T$ : CA3193 .....3.7nA/ $^{\circ}$ C (Max)

### Applications

- Thermocouple Preamplifiers
- Strain Gauge Bridge Amplifiers
- Summing Amplifiers
- Differential Amplifiers
- Bilateral Current Sources
- Log Amplifiers
- Differential Voltmeters
- Precision Voltage References
- Active Filters
- Buffers
- Integrators
- Sample-and-Hold Circuits
- Low Frequency Filters

### Description

The CA3193A and CA3193 are ultra-stable, precision instrumentation, operational amplifiers that employ both PMOS and bipolar transistors on a single monolithic chip. The CA3193A and CA3193 amplifiers are internally phase compensated and provide a gain bandwidth product of 1.2MHz. They are pin compatible with the industry 741 series and many other IC op amps, and may be used as replacements for 741 series types in most applications.

The CA3193A and CA3193 can also be used as functional replacements for op amp types 725, 108A, OP-5, OP-7, LM11 and LM714 in many applications where nulling is not employed. Because of their low offset voltage and low offset voltage vs temperature coefficient the CA3193A and CA3193 amplifiers have a wider range of applications than most op amps and are particularly well suited for use as thermocouple amplifiers, high gain filters, buffer, strain gauge bridge amplifiers and precision voltage references.

The two types in the CA3193 series are functionally identical. The CA3193A and CA3193 operate from supply voltages of  $\pm 3.5V$  to  $\pm 18V$ .

### Part Number Information

PART NUMBER	TEMP. RANGE ( $^{\circ}$ C)	PACKAGE	PKG. NO.
CA3193AE	-25 to 85	8 Ld PDIP	E8.3
CA3193E	0 to 70	8 Ld PDIP	E8.3

### Pinout

# CA3193, CA3193A

## Absolute Maximum Ratings

DC Supply Voltage	±18V
Differential Input Voltage	5V
DC Input Voltage	(V+ -4), V-
Input Current	1mA
Output Short Circuit Duration (Note 2)	Indefinite

## Thermal Information

Thermal Resistance (Typical, Note 1)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
PDIP Package	100	N/A
Maximum Junction Temperature (Plastic Package)	150°C	
Maximum Storage Temperature Range	-65°C to 150°C	
Maximum Lead Temperature (Soldering 10s)	300°C	

## Operating Conditions

Temperature Range	
CA3193A	-25°C to 85°C
CA3193	0°C to 70°C

*CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.*

### NOTES:

- $\theta_{JA}$  is measured with the component mounted on an evaluation PC board in free air.
- Short circuit may be applied to ground or to either supply.

## Electrical Specifications $T_A = 25^\circ\text{C}$ , $V_{\text{SUPPLY}} = \pm 15\text{V}$ , Unless Otherwise Specified

## Schematic Diagrams

FIGURE 5. CA3193 SIMPLIFIED SCHEMATIC DIAGRAM

FIGURE 6. SCHEMATIC DIAGRAM OF CA3193A AND CA3193

**Application Information**

**Circuit Description**

The block diagram of the CA3193 amplifier shows the voltage gain and supply current for each of its four amplifier stages. Simplified and complete schematic diagrams of the CA3193 amplifier are shown in Figures 5 and 6, respectively.

A quad of physically cross-connected NPN transistors comprise the input-stage differential pair ( $Q_1, Q_2$  in Figures 5 and 6); this arrangement contributes to the low input offset-voltage characteristics of the amplifier. The ultra-high gain provided in the first stage ensures that subsequent stages cannot significantly influence the overall offset-voltage characteristics of the amplifier. High load impedances for the input-stage differential pair ( $Q_1, Q_2$ ) are provided by the cascode-connected PNP transistors  $Q_3, Q_5$  and  $Q_4, Q_6$ , thereby contributing to the high gain developed in the stage.

The second stage of the amplifier consists of a differential amplifier employing PMOS/FETs ( $Q_7, Q_8$  in Figures 5 and 6) with appropriate drain loading. Since  $Q_7$  and  $Q_8$  are MOS/FETs, their loading on the first stage is quite low, thereby making an additional contribution to the high gain developed in the first stage. The second stage is also configured to convert its differential signal to a single-ended output signal by means of current mirror  $D_9, Q_{30}$  (Figures 5 and 6) to drive subsequent gain stage.

The third stage of the amplifier consists of Darlington-connected NPN transistors ( $Q_{17}, Q_{19}$  in Figures 5 and 6), driving the quasi-complementary Class AB output stage

( $Q_{14}$  and  $Q_{15}, Q_{16}$  in Figures 5 and 6). Output-stage short-circuit protection is activated by voltage drops developed across the  $60\Omega$  resistors adjacent to the output terminal ( $R_9$  and  $R_{10}$ , Figure 6). When the voltage drop developed across either of these resistors reaches a potential equal to  $1 V_{BE}$ , the respective protective transistor ( $Q_{12}$  or  $Q_{13}$ ) is activated and shunts the base drive from the bases of the output stage transistors ( $Q_{14}$  and  $Q_{15}, Q_{16}$ ).

Internal frequency compensation for the CA3193 amplifier is provided by two internal networks, a 6pF capacitor connected between the input-stage transistor collectors and the node between the third and output stages and a second network, consisting of a 20pF capacitor in series with a 7.5k $\Omega$  resistor connected between the input and output nodes of the third stage.

**Offset Voltage Nulling**

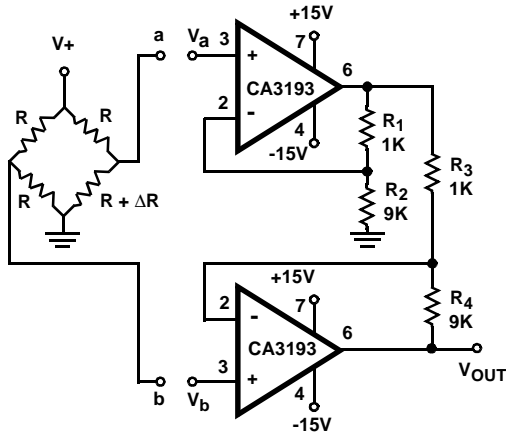

The input offset voltage can be nulled to zero by any of the three methods shown in the table below. A 10K potentiometer between terminals 1 and 5, with its wiper returned to  $V_-$ , will provide a gross nulling for all types. For finer nulling, either of the other two circuits shown below may be used, thus providing simpler improved resolution for all types.

CAUTION: The CA3193 amplifiers will be damaged if they are plugged into op amp circuits employing nulling with respect to the  $V_+$  supply bus.

**Offset Voltage Nulling**

OFFSET NULLING CIRCUITS			
TYPE	RESISTOR R VALUE	RESISTOR R VALUE	RESISTOR R VALUE
CA3193A	10K	50K	10K
CA3193	10K	20K	5K
	Gross Offset Adjustment	Finer Offset Adjustments	

Typical Applications

$$V_{OUT} = -V_a \left( \frac{R_2}{R_1} + 1 \right) \frac{R_4}{R_3} + V_b \left( \frac{R_4}{R_3} + 1 \right)$$

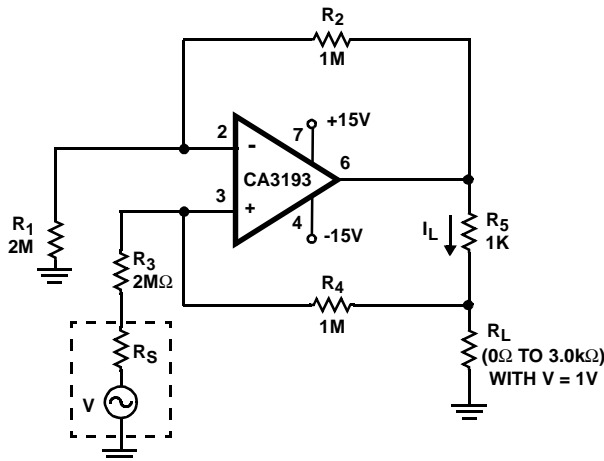

For Ideal Resistors with  $\frac{R_1}{R_2} = \frac{R_3}{R_4}$

$$V_{OUT} = V_b - V_a \left( \frac{R_4}{R_3} + 1 \right)$$

$$A = \frac{V_{OUT}}{V_b - V_a} = \left( \frac{R_4}{R_3} + 1 \right)$$

FOR VALUES ABOVE  $V_{OUT} = (V_b - V_a) (A)$

FIGURE 7. TYPICAL TWO OP AMP BRIDGE-TYPE DIFFERENTIAL AMPLIFIER

ALL RESISTORS ARE 1%  
IF  $R_1 = R_3$  AND  $R_2 = R_4 + R_5$ , THEN  
 $I_L$  IS INDEPENDENT OF VARIATIONS IN  $R_L$   
FOR  $R_L$  VALUES OF  $0\Omega$  TO  $3k\Omega$  WITH  $V = 1V$

$$I_L = \frac{VR_4}{R_3R_5} = \frac{V(1M)}{(2M)(1K)} = \frac{V}{2K} = 500\mu A$$

FIGURE 9. USING CA3193 AS A BILATERAL CURRENT SOURCE

ALL RESISTANCE VALUES ARE IN OHMS.

$$V_{OUT} = V_2 \left( \frac{R_4}{R_3 + R_4} \right) \left( \frac{R_1 + R_2}{R_1} \right) - V_1 \left( \frac{R_2}{R_1} \right)$$

If  $R_4 = R_2$ ,  $R_3 = R_1$  and  $\frac{R_2}{R_1} = \frac{R_4}{R_3}$

$$\text{THEN } V_{OUT} = (V_2 - V_1) \left( \frac{R_2}{R_1} \right)$$

For values above  $V_{OUT} = 2(V_2 - V_1)$ :

If  $A_V$  is To be made 1 and if  $R_1 = R_3 = R_4 = R$  with  $R_2 = 0.999R$  (0.1% mismatch in  $R_2$ )

Then  $V_{OCM} = 0.0005 V_{IN}$  or  $CMRR = 66dB$

Thus, the  $CMRR$  of this circuit is limited by the matching or mismatching of this network rather than the amplifier.

FIGURE 8. DIFFERENTIAL AMPLIFIER (SIMPLE SUBTRACTER) USING CA3193

$$V_{OUT} = - \left( \frac{R_F}{R_1} V_1 + \frac{R_F}{R_2} V_2 + \frac{R_F}{R_3} V_3 \right)$$

$$V_{OUT} = -(2V_1 + 2V_2 + 2V_3)$$

ALL RESISTANCE VALUES ARE IN OHMS.

Dual-In-Line Plastic Packages (PDIP)

NOTES:

- Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and  $e_A$  are measured with the leads constrained to be perpendicular to datum  $-C-$ .
- $e_B$  and  $e_C$  are measured at the lead tips with the leads unconstrained.  $e_C$  must be zero or greater.
- B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).
