

CMOS 21-Stage Counter

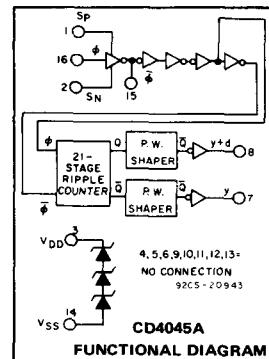

The RCA-CD4045A is a timing circuit consisting of 21 counter stages, two output-shaping flip-flops, two inverter output drivers, three 5.5-V zener diodes (providing transient protection at 16.5 V), and input inverters for use in a crystal oscillator. The CD4045A configuration provides 21 flip-flop counting stages, and two flip-flops for shaping the output waveform for a 3.125% duty cycle. Push-pull operation is provided by the inverter output drivers.

The first inverter is intended for use as a crystal oscillator/amplifier. However, it may be used as a normal logic inverter if desired. A crystal oscillator circuit can be made less sensitive to voltage-supply variations by the use of source resistors. In this device, the sources of the p and n transistors have been brought out to package terminals. If external resistors are not required, the sources must be shorted to their respective substrates (S_p to V_{DD} ; S_n to V_{SS}). See Fig. 3.

These types are supplied in 16-lead hermetic dual-in-line ceramic packages (D and F suffixes), 16-lead dual-in-line plastic packages (E suffix), 16-lead ceramic flat packages (K suffix), and in chip form (H suffix).

NOTE 1: To minimize power dissipation in the zener diodes, and to ensure device dissipation less than 200 mW, a 150 Ω current-limiting resistor must be placed in series with the power supply for $V_{DD} > 13$ V.

NOTE 2: Observe power-supply terminal connections, V_{DD} is terminal No. 3 and V_{SS} is terminal No. 14 (not 16 and 8 respectively, as in all other CD4000A Series 16-lead devices).
