NOTES:

1. Driver mounted on H225 horn.
2. 2 hours test made with continuous pink noise signal(6dB creast factor) within the specified range.
3. Continuous Program Power is defined as 3dB greater than the AES power.
4. Sensitivity is measured at 1W input on rated impedance at 1m on axis from the mouth of a horn and averaged between 1kHz and 16kHz.
5. Frequency range is defined as the band of frequencies delineated by the lower and upper limits where the output level drops by 10dB below the rated sensitivity.

Frequency response curve of the driver measured with 1w input on rated impedance at 1m distance on axis from the mouth of H225 horn
