

## ■ INTRODUCTION

The CE6216 Series are a group of positive voltage regulators manufactured by CMOS technology with high ripple rejection, ultra-fast transient response and low dropout voltage, which consume less than 1 $\mu$ A in shutdown mode and can provide large output currents even when the difference of the input-output voltage is small. Each of the CE6216 series consists of a high-precision voltage reference, an error correction circuit, and a current limited output driver. Thus the series are very suitable for the battery-powered equipments, wireless communication applications, industry equipments and so on.
