ADVANCE INFORMATION

CG6258AM

4Mb (256K x 16) Pseudo Static RAM

Features

- Wide voltage range: **2.70V–3.30V**
- Access Time: 70ns
- Ultra-low active power
  - **— Typical active current: 2.0mA @ f = 1 MHz**
  - **— Typical active current: 13mA @ f = f_{max}**
- Ultra low standby power
- Easy memory expansion with $\overline{CE}$, CE_2, and $\overline{OE}$ features
- Automatic power-down when deselected
- CMOS for optimum speed/power
- Offered in a 48 Ball BGA Package

Functional Description[1]

The CG6258AM is a high-performance CMOS Pseudo static RAM organized as 256K words by 16 bits that supports an asynchronous memory interface. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life® (MoBL) in portable applications such as cellular telephones. The device can be put into standby mode reducing power consumption by more than 99% The device can also be put into standby mode when deselected ($\overline{CE}$ HIGH or CE_2 LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH). The input/output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when: deselected ($\overline{CE}$ HIGH or CE_2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or during a write operation ($\overline{CE}$ LOW, CE_2 HIGH and $\overline{WE}$ LOW). **The addresses must not be toggled once the read is started on the device.**

Writing to the device is accomplished by taking Chip Enables ($\overline{CE}$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{17}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{17}).

Reading from the device is accomplished by taking Chip Enables ($\overline{CE}$ LOW and CE_2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7. If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O_8 to I/O_{15}. See the truth table at the back of this datasheet for a complete description of read and write modes

Note:

2. NC "no connect" - not connected internally to the die.
3. DNU pins are to be left floating or tied to Vss.
4. Ball G2 and H6 are the expansion pins for the 16Mb and 32Mb density resectively.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature .....–65°C to + 150°C

Ambient Temperature with Power Applied.....–55°C to + 85°C

Supply Voltage to Ground Potential..... –0.4V to 4.6V

DC Voltage Applied to Outputs in High Z State[5, 6, 7] .....–0.2V to 3.3V

DC Input Voltage[5, 6, 7].....–0.2V to 3.3V

Output Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage ..... >2001V (per MIL-STD-883, Method 3015)

Latch-Up Current .....>200 mA

Notes:

5. $V_{IH(MAX)}$ = V_{CC} + 0.5V for pulse durations less than 20ns.
6. $V_{IL(MIN)}$ = -0.5V for pulse durations less than 20ns.
7. Overshoot and undershoot specifications are characterized and are not 100% tested.
8. Typical values are included for reference only and are not guranteed or tested. Typical values are measured at V_{CC} = V_{CC} (typ) and T_A = 25C
9. V_{CC} must be at minimal operational levels before inputs are turned ON.

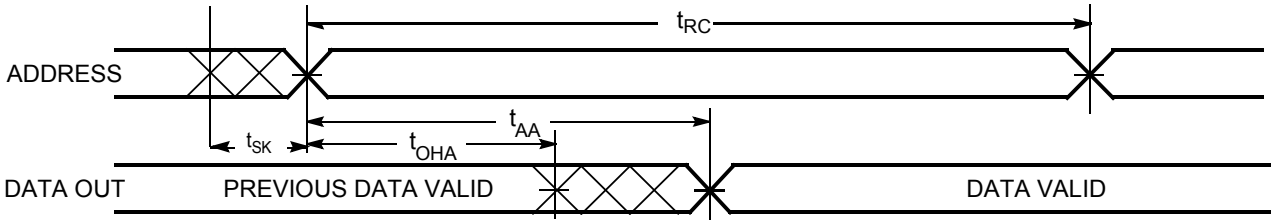
Notes:

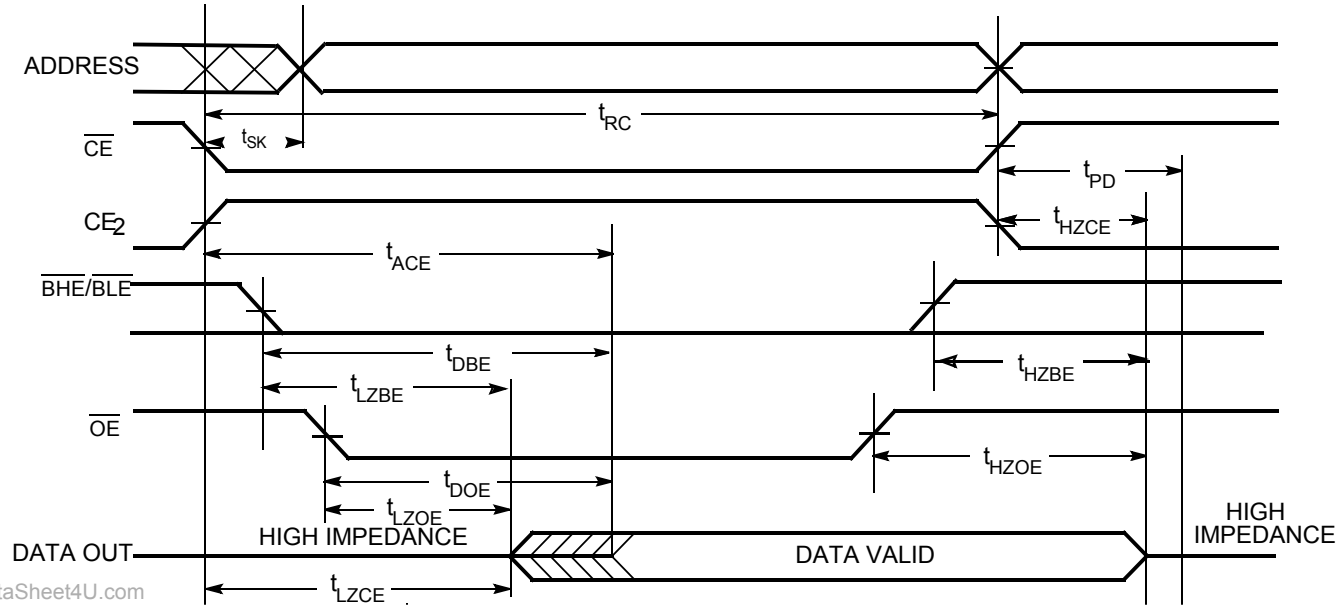
11. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1ns/V, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ.)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" section..
12. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the outputs enter a high impedence state.
13. The internal Write time of the memory is defined by the overlap of WE, CE = V_{IL}, BHE and/or BLE = V_{IL}, and CE_2 = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.
14. High-Z and Low-Z parameters are characterized and are not 100% tested.

Switching Waveforms

Read Cycle 1 (Address Transition Controlled)[15, 16]



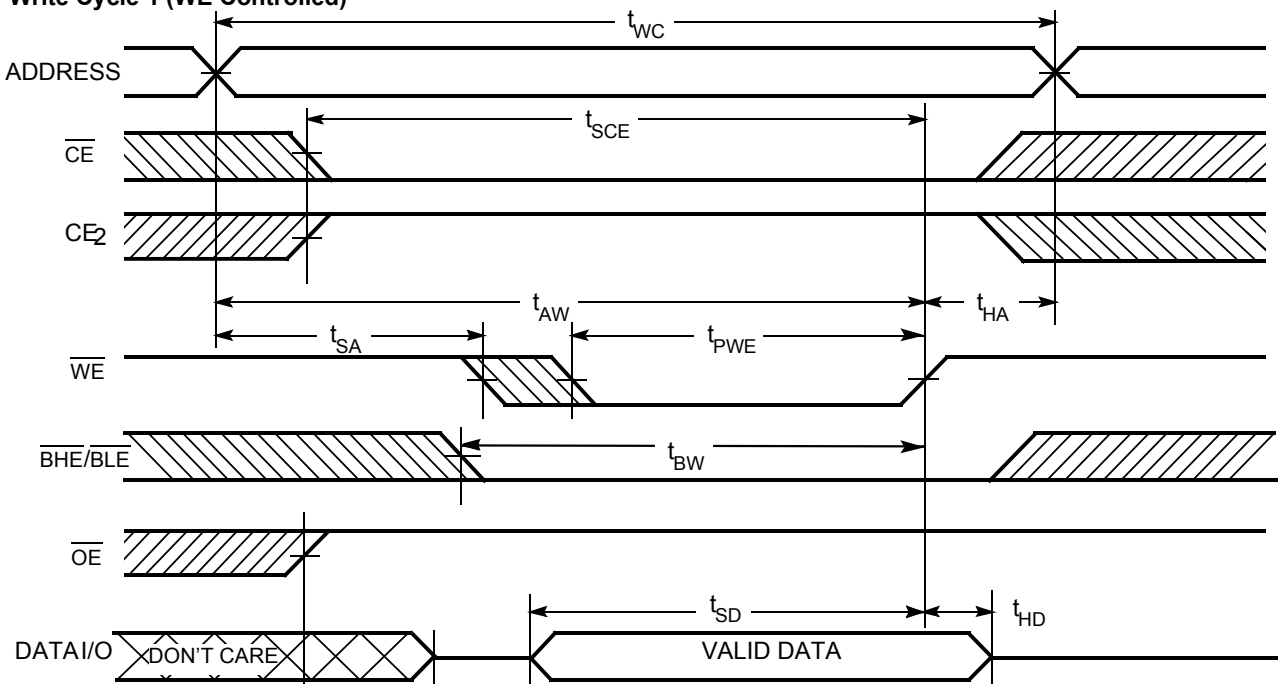
Read Cycle 2 ($\overline{OE}$ Controlled)[15, 16]



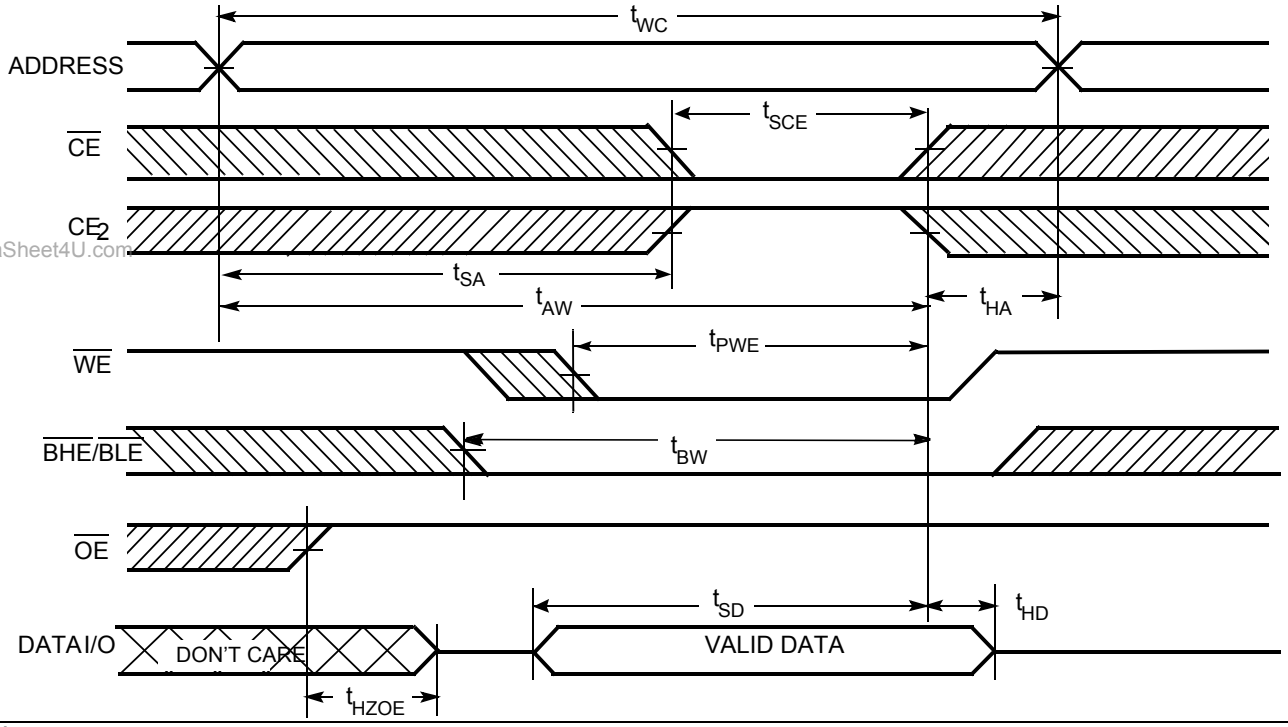
Note:
15. $\overline{WE}$ is HIGH for read cycle.
16. **Addresses should not be toggled after the start of a read cycle**

Switching Waveforms (continued)

Write Cycle 1 ($\overline{WE}$ Controlled) [13, 14,17, 18, 19]



Write Cycle 2 ($\overline{CE}$ or CE_2 Controlled) [13, 14,17, 18, 19]

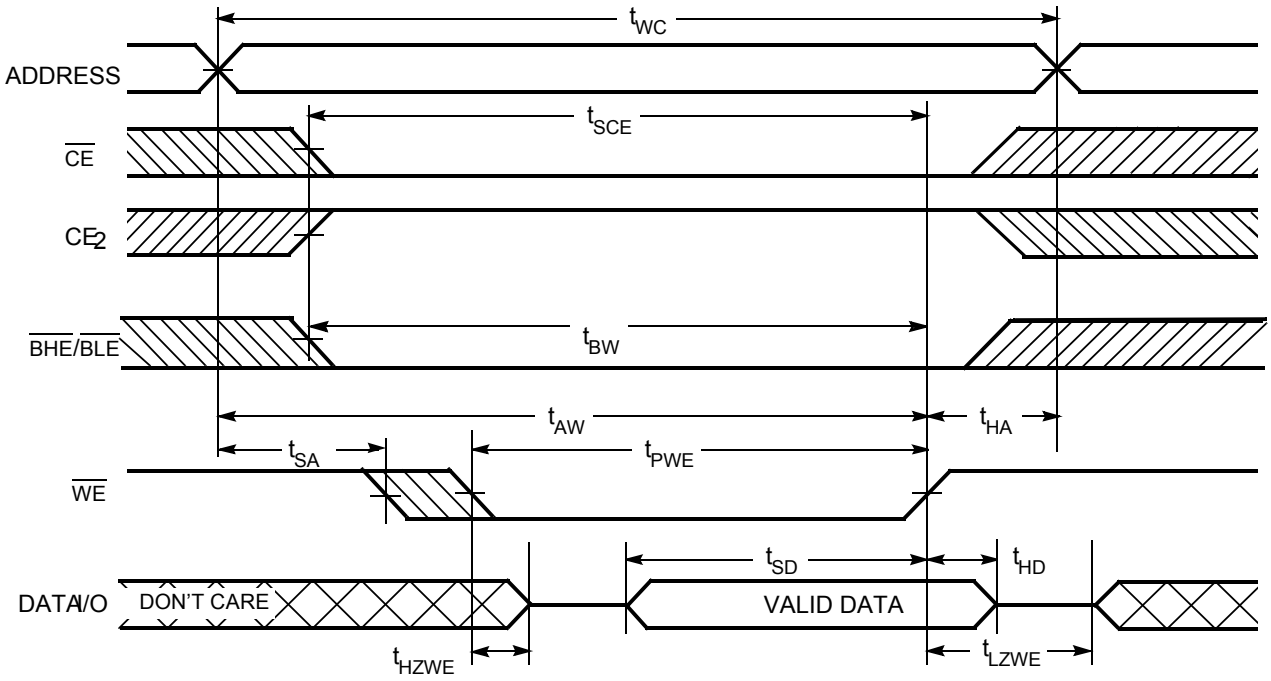


Notes:

17. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
18. If Chip Enable goes INACTIVE and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high-impedance state.
19. During the DON'T CARE period in the DATA I/O waveform, the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued)

Write Cycle 3 (WE Controlled, OE LOW)[18, 19]



Write Cycle 4 (BHE/BLE Controlled, OE LOW)[18, 19]
