

CGS74B303 Octal Divide-by-2 Skew Clock Driver

General Description

These minimum skew clock drivers are designed for high frequency Clock Generation and Support (CGS) applications. These devices are ideal for duty cycle recovery applications with internal frequency divide-by-2 circuitry. The devices guarantee minimum output skew across the outputs of a given device. Skew parameters are also provided as a means to measure duty cycle requirements as those found in high speed clocking systems.

Functional Description

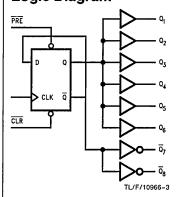

The CGS74B303 contains eight flip-flops designed to have low skew between outputs. The eight outputs (six in-phase with CLK and two out-of-phase) toggle on successive CLK pulses. $\overline{\text{PRE}}$ and $\overline{\text{CLR}}$ inputs are provided to set Q and $\overline{\text{Q}}$ outputs high or low independent of CLK pin.

Features

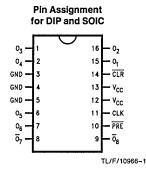

- Clock Generation and Support (CGS) Devices ideal for high frequency signal generation or clock distribution applications
- CGS74B version features National's Advanced Bipolar FAST™ LSI process
- 1 ns pin-to-pin output skew
- Specification for transition skew to meet duty cycle requirements
- Current sourcing 24 mA and current sinking of 48 mA
- Low dynamic power consumption above 20 MHz
- Guaranteed 4 kV ESD protection

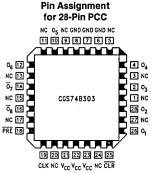

Ordering Code: See Section 5

Pin Description

Pin Names	Description
CLK	Clock Input
O ₁ -O ₈	Outputs
PRE	Preset
CLR	Clear

Truth Table

	Inputs	ı	Outputs			
CLR	PRE	CLK	01-05	Ō ₇ −Ō ₈		
L	Н	Х	L	Н		
Н	L	Х	н	L		
L	L	Χ	L*	L*		
н	Н	1	ā	Q		
Н	H	L	Q	Q		

*This state will not persist when CLR/PRE returns to high.

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (V _{CC})				7.0V
Input Voltage (V _I)				7.0V
Operating Free	74B303	1	0°C to	+70°C
Air Temperature	64B303	-4	0°C to	+85°C
Storage Temperature Range		-65	°C to +	150°C
Typical θ_{JA}			303/30	04/305
Airflow (LFM)	0	225	500	
Plastic (N) Package	95	70	60	°C/W
Jedec SOIC (M) Package	118	96	86	°C/W
PCC (V) Package	69	53	45	°C/W

Recommended Operating Conditions

NOTE: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the DC and AC Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The Recommended Operating Conditions will define the conditions for actual device operation.

DC Electrical Characteristics CGS74/64B303/304/305

Over recommended operating free air temperature range. All typical values are measured at $V_{CC} = 5V$, $T_A = 25^{\circ}C$.

^{*}Voltage Range 5.0 is 5.0V ± 0.5 V

Note 1: Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH to LOW (t_{OSHL}) or LOW to HIGH (t_{OSLH}) or in opposite directions both HL and LH (t_{OST}). Parameters t_{OST} and t_{PS} guaranteed by design.

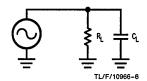

Note 2: This device is sensitive to noise due to the large transient currents which occur during multiple switching of the eight outptus. V_{VV} by-pass capacitor(s), chip types, must be placed as closely as possible to the V_{CC} pin.

Test Circuit

R_L is 500Ω

 C_L is 50 pF for all prop delays and skew measurements. C_L is 30 pF for t_{rise} and t_{fall} measurements.

- Refer to Minimum Skew Parameters Measurement Information Chart for definitions of each skew specification.
- All input pulses are from 3.5V to 0.3V with rise and fall times of 2.0 ns.
- Load capacitance includes the test jig.
