

CHT-OPA DATASHEET

Revision: 2.5
*Dec. 30, 2014*High-Temperature General-Purpose Quad
Operational Amplifier

General Description

The CHT-OPA is a general-purpose quad operational amplifier for applications over the temperature range from -55 to 225°C.

The CHT-OPA can operate with both single and symmetrical power supplies. The supply voltages range goes from 4.5 to 20V.

The CHT-OPA uses internal metal lines presenting extremely high immunity to electromigration, improving product lifetime.

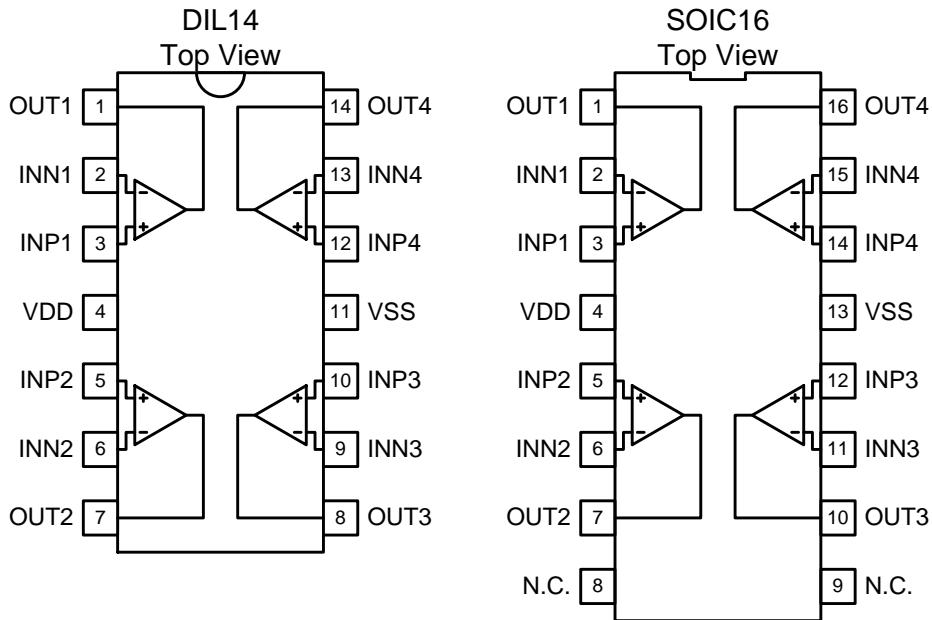

Features

- Qualified from -55 to +225°C (T_j)
- 4.5 to 20V supply voltages
- Single or symmetrical supply operation
- Latchup-free at any supply and temperature condition
- Validated at 225°C for 30000 hours (and still on-going)
- Available in DIL14 and SOIC16 hermetic ceramic standard packages

Applications

- Well logging, Automotive, Aeronautics & Aerospace
 - Harsh Environments

³ Output current is not internally limited. Value given indicate the maximum recommended conditions.

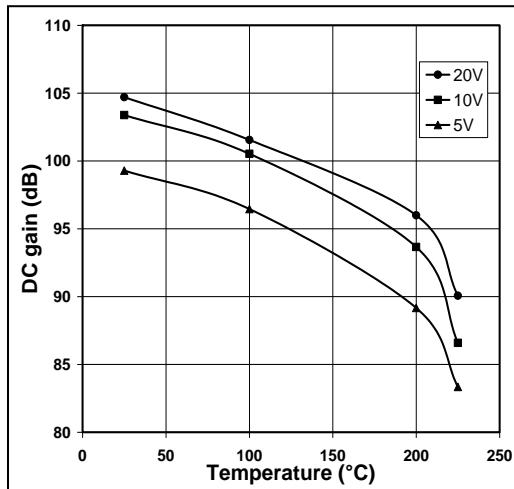

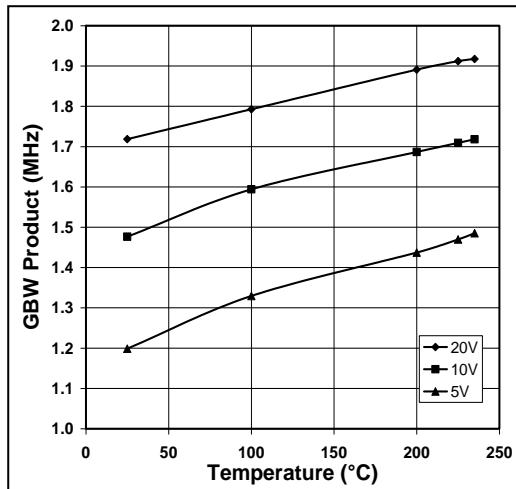

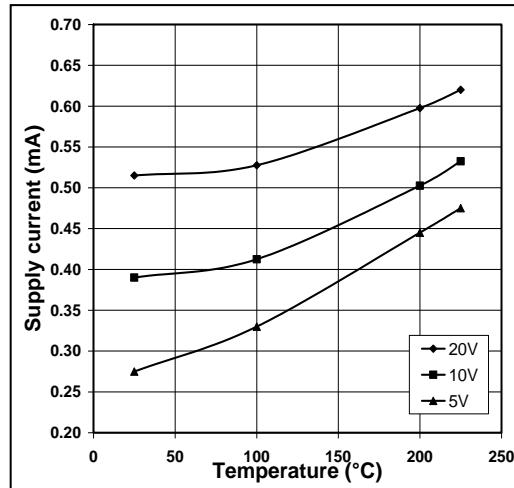

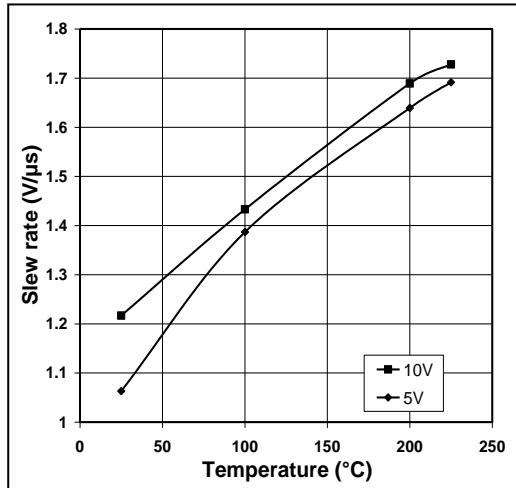

⁴ The absolute value of the input offset voltage, $|V_{IOFF}|$, decreases as temperature increases. TC_{VIOFF} must be used so that $|V_{IOFF}|$ decreases with temperature, i.e. TC_{VIOFF} has opposite sign than V_{IOFF} .

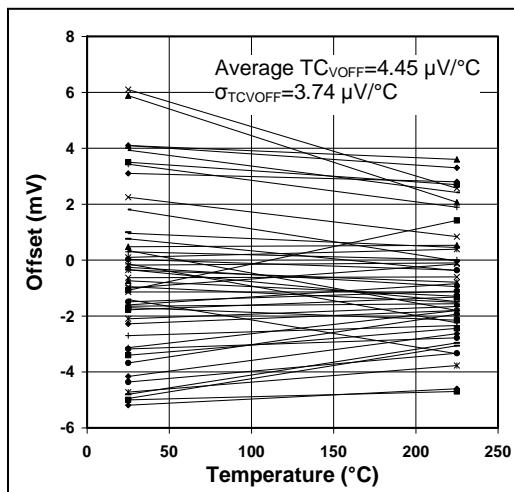

⁵ Due to ESD structures. Under full characterization.

Circuit Functionality

Operating conditions

The CHT-OPA has been qualified to operate with supply voltages ranging from 4.5V to 20V and temperatures from -55°C to 225°C. Device characteristics vary smoothly outside the qualification temperature range.

With supply voltage above 5.5V, the CHT-OPA must be used in closed loop configuration under linear regime. If the application fails to be compliant to this requirement, this will lead to violation of the "Safe Operating Area" conditions inside the CHT-OPA device.

For supply voltages below 5.5V, no limitation on the operation regime exists and the part can even be used as comparator. When CHT-OPA is used in non-linear regime (eg used as comparator), if the voltage difference between the 2 input pins exceeds 2V typ., current will flow between

the 2 input pins according to following formula:

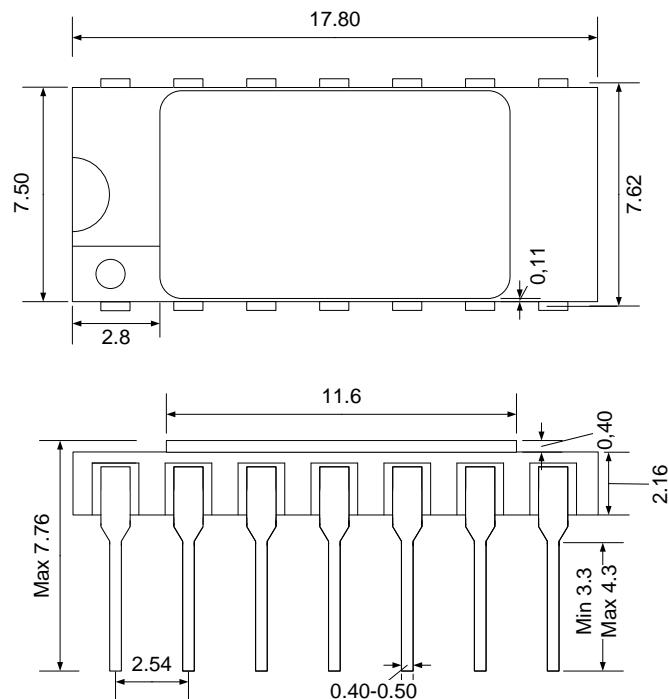

$$I = \frac{V(INP) - V(INN) - 2V}{20K\Omega}$$

Specific Operating Conditions

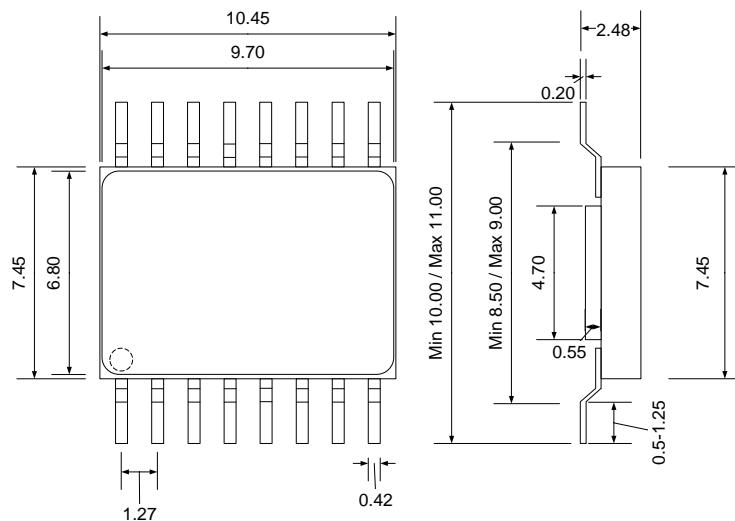

The CHT-OPA presents slightly different positive and negative slewing values. This makes that when a square wave is used as input signal, the output presents an additional DC offset due to the slight change of the output duty cycle.

Additionally, for square input signals with frequencies above 10kHz, the circuit presents an output DC offset which increases with the input frequency. At 30kHz, the input referred offset increases by about 20mV.
