

***OLED Smart Watch Display
Driver IC Specification***

CO5300

Specification Version

Model No : CO5300
Document Version : V0.00
Release Date : 28. Mar. 2023

Chipone Technology (Beijing) Co.,Ltd.

| REVISION HISTORY | 2 |
| 1. DESCRIPTION | 6 |
| 2. FEATURES | 7 |
| 3. DEVICE OVERVIEW | 10 |
| 3.1 BLOCK DIAGRAM | 10 |
| 4. PIN DESCRIPTION | 11 |
| 4.1 PINS FOR POWER INPUT | 11 |
| 4.2 PINS FOR QSPI INTERFACE | 12 |
| 4.3 PINS FOR MIPI INTERFACE | 13 |
| 4.4 PINS FOR INTERFACE LOGIC CONTROL | 14 |
| 4.5 PINS FOR ANALOG OUTPUT OF OLED DISPLAY DRIVING | 15 |
| 4.6 PINS FOR DC/DC CONVERT PINS | 16 |
| 4.7 TEST PINS | 18 |
| 5. FUNCTION DESCRIPTION | 19 |
| 5.1 INTERFACE SELECTION | 19 |
| 5.2 QUAD SPI INTERFACE | 20 |
| 5.2.1 QUAD SPI command format | 20 |
| 5.2.2 Write Cycle and Sequence | 21 |
| 5.2.3 Read Cycle and Sequence | 28 |
| 5.2.4 QUAD SPI Function | 29 |
| 5.3 TEARING EFFECT OUTPUT | 31 |
| 5.3.1 Tearing Effect Line Mode | 31 |
| 5.3.2 Tearing Effect Line Timing | 33 |
| 5.4 DISPLAY SERIAL INTERFACE (DSI) MIPI INTERFACE | 34 |
| 5.4.1 Interface Level Communication | 34 |
| 5.4.2 Interface Level Communication - DSI Data Lane | 43 |
| 5.4.3 Packet Level Communication | 54 |
| 5.4.4 Packet Transmissions | 69 |
| 5.4.5 Communication Sequences | 85 |
| 5.4.6 Video Mode Communication | 91 |
| 5.4.7 Display Data Format | 95 |
| 5.5 GAMMA FUNCTION | 98 |
| 5.6 POWER ON/ OFF SEQUENCE | 99 |
| 5.6.1 Power Stage Diagram | 99 |
| 5.6.2 Power ON Sequence | 100 |
| 5.6.3 Power OFF Sequence | 101 |
| 6. ELECTRICAL CHARACTERISTICS | 102 |
| 6.1 ABSOLUTE MAXIMUM RATINGS | 102 |
| 6.2 DC CHARACTERISTICS | 103 |
| 6.3 MIPI DC CHARACTERISTICS | 105 |
| 6.3.1 DC Characteristics for DSI LP Mode | 105 |
| 6.3.2 DC Characteristics for DSI HS Mode | 106 |
| 6.4 AC TIMINGS CHARACTERISTICS | 107 |
| 6.4.1 Serial Interface Characteristics (QUAD SPI) | 107 |
| 6.4.2 Vertical Timings for DSI video mode | 108 |
| 6.4.3 Horizontal Timings for DSI video mode | 109 |
| 6.5 MIPI AC CHARACTERISTICS | 110 |
| 6.5.1 High Speed Mode - Clock Timings | 110 |
| 6.5.2 High Speed Mode - Clock / Data Timings | 110 |
| 6.5.3 High Speed Mode - Rising and Falling Timings | 111 |
| 6.5.4 Low Speed Mode - Bus Turn Around | 112 |
| 6.5.5 Data Lanes from Low Power Mode to High Speed Mode | 113 |
| 6.5.6 Data Lanes from High Speed Mode to Low Power Mode | 114 |

| | |
|---|------------|
| 6.5.7 DSI Clock Burst – High speed mode to /from Low Power Mode | 115 |
| 6.6 RESET INPUT TIMING | 116 |
| 7. COMMAND | 117 |
| 7.1 COMMAND TABLE SWITCH FLOW | 117 |
| 7.2 PASS WORD COMMAND DESCRIPTION IN UCS (COMMAND1) | 118 |
| 7.2.1 PASSWD1 | 118 |
| 7.3 PASS WORD COMMAND DESCRIPTION IN MCS (COMMAND2) | 120 |
| 7.3.1 PASSWD2 | 120 |
| 7.4 COMMAND LIST | 122 |
| 7.5 COMMAND DESCRIPTION | 126 |
| 7.5.1 NOP: NOP (00h) | 126 |
| 7.5.2 SWRESET: Software Reset (01h) | 127 |
| 7.5.3 RDDID: Read Display ID (04h) | 128 |
| 7.5.4 RDNUMED: Read Number of Errors on DSI (05h) | 130 |
| 7.5.5 RDDPM: Read Display Power Mode (0Ah) | 131 |
| 7.5.6 RDDMADCTR: Read Display MADCTR (0Bh) | 133 |
| 7.5.7 RDDCOLMOD: Read Display Pixel Format (0Ch) | 135 |
| 7.5.8 RDDIM: Read Display Image Mode (0Dh) | 137 |
| 7.5.9 RDDIM: Read Display Signal Mode (0Eh) | 139 |
| 7.5.10 RDDSDR: Read Display Self-Diagnostic Result (0Fh) | 141 |
| 7.5.11 SLPIN: Sleep In (10h) | 143 |
| 7.5.12 SLOUT: Sleep Out (11h) | 145 |
| 7.5.13 PARON: Partial Display Mode ON (12h) | 147 |
| 7.5.14 NORON: Normal Display Mode ON (13h) | 148 |
| 7.5.15 INVOFF: Display Inversion OFF (20h) | 149 |
| 7.5.16 INVON: Display Inversion ON (21h) | 150 |
| 7.5.17 ALLPOFF: All Pixel OFF (22h) | 151 |
| 7.5.18 ALLPON: All Pixel ON (23h) | 153 |
| 7.5.19 DISPOFF: Display OFF (28h) | 155 |
| 7.5.20 DISPON: Display ON (29h) | 157 |
| 7.5.21 CASET: Set Column Start Address (2Ah) | 159 |
| 7.5.22 RASET: Set Row Start Address (2Bh) | 161 |
| 7.5.23 RAMWR: Memory Start Write (2Ch) | 163 |
| 7.5.24 RAMWR: Memory Start Read (2Eh) | 164 |
| 7.5.25 PTLAR: Set Vertical Partial Area (30h) | 165 |
| 7.5.26 PTLAR_H: Set Horizontal Partial Area (31h) | 167 |
| 7.5.27 TEOFF: Tearing Effect Line OFF (34h) | 169 |
| 7.5.28 TEON: Tearing Effect Line ON (35h) | 170 |
| 7.5.29 MADCTL: Memory Data Access Control (36h) | 172 |
| 7.5.30 IDMOFF: Idle mode OFF (38h) | 174 |
| 7.5.31 IDMON: Idle mode ON (39h) | 175 |
| 7.5.32 COLMOD: Interface Pixel Format (3Ah) | 176 |
| 7.5.33 RAMWR: Memory Continuous Write (3Ch) | 178 |
| 7.5.34 RAMWR: Memory Continuous Read (3Eh) | 179 |
| 7.5.35 STESL: Set Tearing Effect Scan Line (44h) | 180 |
| 7.5.36 GSL: Get Scan Line (45h) | 182 |
| 7.5.37 DSTBON: Deep Standby Mode On (4Fh) | 183 |
| 7.5.38 WRDISBV: Write Display Brightness (51h) | 184 |
| 7.5.39 RDDISBV: Read Display Brightness (52h) | 185 |
| 7.5.40 WRCTRLD: Write CTRL Display (53h) | 186 |
| 7.5.41 RDCTRLD: Read CTRL Display (54h) | 188 |
| 7.5.42 WRACL: Read ACL Control (55h) | 190 |
| 7.5.43 RDACL: Read ACL Control (56h) | 191 |
| 7.5.44 WRIMGEHCCTR: Set Color Enhance Control (58h) | 192 |
| 7.5.45 RDIMGEHCCTR: Read Color Enhance Control (59h) | 194 |

| | |
|---|------------|
| 7.5.46 WRHBMDISBV: Write HBM Display Brightness (63h) | 196 |
| 7.5.47 WRDISBV: Read HBM Display Brightness (64h) | 197 |
| 7.5.48 RDHBMDISBV: Read HBM Display Brightness (65h) | 198 |
| 7.5.49 HBM Mode: Set HBM Mode (66h) | 199 |
| 7.5.50 COLSET: Interface Pixel Format Set (70~7Fh)..... | 200 |
| 7.5.51 COLOPT: Interface Pixel Format Option (80h) | 205 |
| 7.5.52 RDDDBS: Read DDB Start (A1h) | 208 |
| 7.5.53 RDDDBC: Read DDB Continuous (A8h) | 210 |
| 7.5.54 RDFCS: Read First Checksum (AAh) | 212 |
| 7.5.55 RDCCS: Read Continuous Checksum (AFh) | 213 |
| 7.5.56 SetDISPMode: Set Display Mode (C2h) | 214 |
| 7.5.57 SetSPIMode: Set_SPI Mode (C4h) | 216 |
| 7.5.58 RDID1: Read ID1 Value (DAh) | 217 |
| 7.5.59 RDID2: Read ID2 Value (DBh)..... | 218 |
| 7.5.60 RDID3: Read ID3 Value (DCh)..... | 219 |
| 7.5.61 CMD Page Switch (FEh)..... | 220 |
| 7.5.62 CMD Page Switch (FFh)..... | 222 |
| 8. APPLICATION | 224 |
| 8.1 DC/DC CONVERTER CIRCUIT | 224 |
| 8.2 EXTERNAL COMPONENTS CONNECTION | 225 |
| 9. IMPORTANT NOTICE | 226 |

CHIPONE CONFIDENTIAL

1. Description

This purpose of this document has been created to provide complete reference specifications for the CO5300. Major of purpose for customers refer to these specifications for system design, quality performance control, and IC applications.

The CO5300 device is a single-chip with RAM display driver integration IC for LTPS AMOLED that incorporates gate drivers, a timing controller with glass interface level-shifters, and a glass power supply circuit that is capable of 480RGBx480, 454RGBx454, 400RGBx400, 390RGBx390, 360RGBx480, 360RGBx360, 340RGBx340, 320RGBx360, 320RGBx320, 320RGBx480, 300RGBx300, 272RGBx480, 240RGBx240, 240RGBx320, 192RGBx960, 180RGBx560, 180RGBx540, 180RGBx360 with internal GRAM including of a 1,843,200 bits internal memory.

The CO5300 supports MIPI Interface and quad serial peripheral interfaces (Quad-SPI). The source resolution can be adjusted 480RGB and the gate resolution only can be set 480 lines. For the detailed resolution setting, please refer to CO5300 Application Note. The specified GRAM window area can be updated selectively, so that moving pictures can be displayed simultaneously independent of the still picture area.

The CO5300 is also able to make gamma correction settings separately for RGB dots to allow benign adjustments to panel characteristics, resulting in higher display qualities. CO5300 includes internal boosters that generate the AMOLED driving voltage, breeder resistance and voltage follower circuit for the AMOLED driver. CO5300 possesses internal GRAM with compression IP that stores 480 x 480 x 1/3 x 24 bits for 16.7M-color images. A deep standby mode is also supported for lower power consumption.

The CO5300 also supports ACL function for the AMOLED brightness control. It's able to reduce the total power consumption of display module significantly and keep AMOLED life time.

This LSI is suitable for wearable device applications, including watch and smart band.

2. Features

- Single chip wearable device AMOLED controller/driver with internal RAM
- Display Resolution support. For detail settings, need to check Application Note
 - 480RGB x 480 (1:6/1:12 Multiplexer for source driver)
 - 454RGB x 454 (1:6/1:12 Multiplexer for source driver)
 - 400RGB x 400 (1:6/1:12 Multiplexer for source driver)
 - 390RGB x 390 (1:6/1:12 Multiplexer for source driver)
 - 360RGB x 480 (1:6/1:12 Multiplexer for source driver)
 - 360RGB x 360 (1:6/1:12 Multiplexer for source driver)
 - 340RGB x 340 (1:6/1:12 Multiplexer for source driver)
 - 320RGB x 360 (1:6/1:12 Multiplexer for source driver)
 - 320RGB x 320 (1:6/1:12 Multiplexer for source driver)
 - 320RGB x 480 (1:6/1:12 Multiplexer for source driver)
 - 300RGB x 300 (1:6/1:12 Multiplexer for source driver)
 - 272RGB x 480 (1:6/1:12 Multiplexer for source driver)
 - 240RGB x 240 (1:6/1:12 Multiplexer for source driver)
 - 240RGB x 320 (1:6/1:12 Multiplexer for source driver)
 - 192RGB x 960 (1:6/1:12 Multiplexer for source driver)
 - 180RGB x 560 (1:6/1:12 Multiplexer for source driver)
 - 180RGB x 540 (1:6/1:12 Multiplexer for source driver)
- Display data RAM (frame memory): 1,843,200 bits
- Display mode (Color mode)
 - Full color mode: 16.7M-colors
 - Reduced Color Mode: 262K-colors
 - Reduced Color Mode: 65K-colors
 - Supported Normal/Idle Display Mode
 - Normal mode: 16.7M-colors, 262K-colors, 65K-colors
 - Idle mode: 16.7M-colors, 4096-colors, 8-colors
- Interface
 - MIPI DSI Interface (D-PHY: V1.0 , DSI:1.01.00, DCS:1.01.00)

MIPI I/F Supported 2 data lanes (Lane numbers are selected by register xxh of CMD2 in MIPI LP mode, and this register can be programmed by MTP)

- ◆ Support 1lane/2lane (1lane: 500Mbps)
- ◆ Maximum total bit rate is 500Mbps with 24-bit data format, 360Mbps with 18-bit data format, 320Mbps with 16-bit data format
- Quad serial peripheral interface (Quad-SPI)

■ Display Feature

- Individual gamma correction settings for RGB dots
- Partial display function

■ On chip

- DC/DC converter
- Supports control signals (VSR_L[10:1]/SW_L[12:1], VSR_R[10:1]/SW_R[12:1],) to gate driver in the AMOLED panel
- Internal Oscillator for display clock generation
- On module checksum checking
- Sunlight readable technology
- VREFP5/VREFN5 voltage generator for panel voltage
- VGHR/VGLR voltage for gate control signal
- Source output MUX[6:1]/MUX[12:1] with 240/120ch source output pins
- Supports gate control signals to gate driver in the panel

■ Built-in OTP function to adjust panel setting

- Provide MTP (2 times) to store related Power, GOA timing, Gamma1~5 settings
- Provide MTP (3 times) to store ID1, ID2, ID3, DDB

■ Self-Diagnostic Function

- ESD detection
- Low Voltage Detection

■ Control power IC by one-wire interface(S-Wire Control)

■ Supply Voltage Range

- Logic / interface power supply voltage VDDI = 1.65V ~ 3.3V

- Analog power supply voltage VCI = 2.7V ~ 3.6V

■ **Output voltage levels**

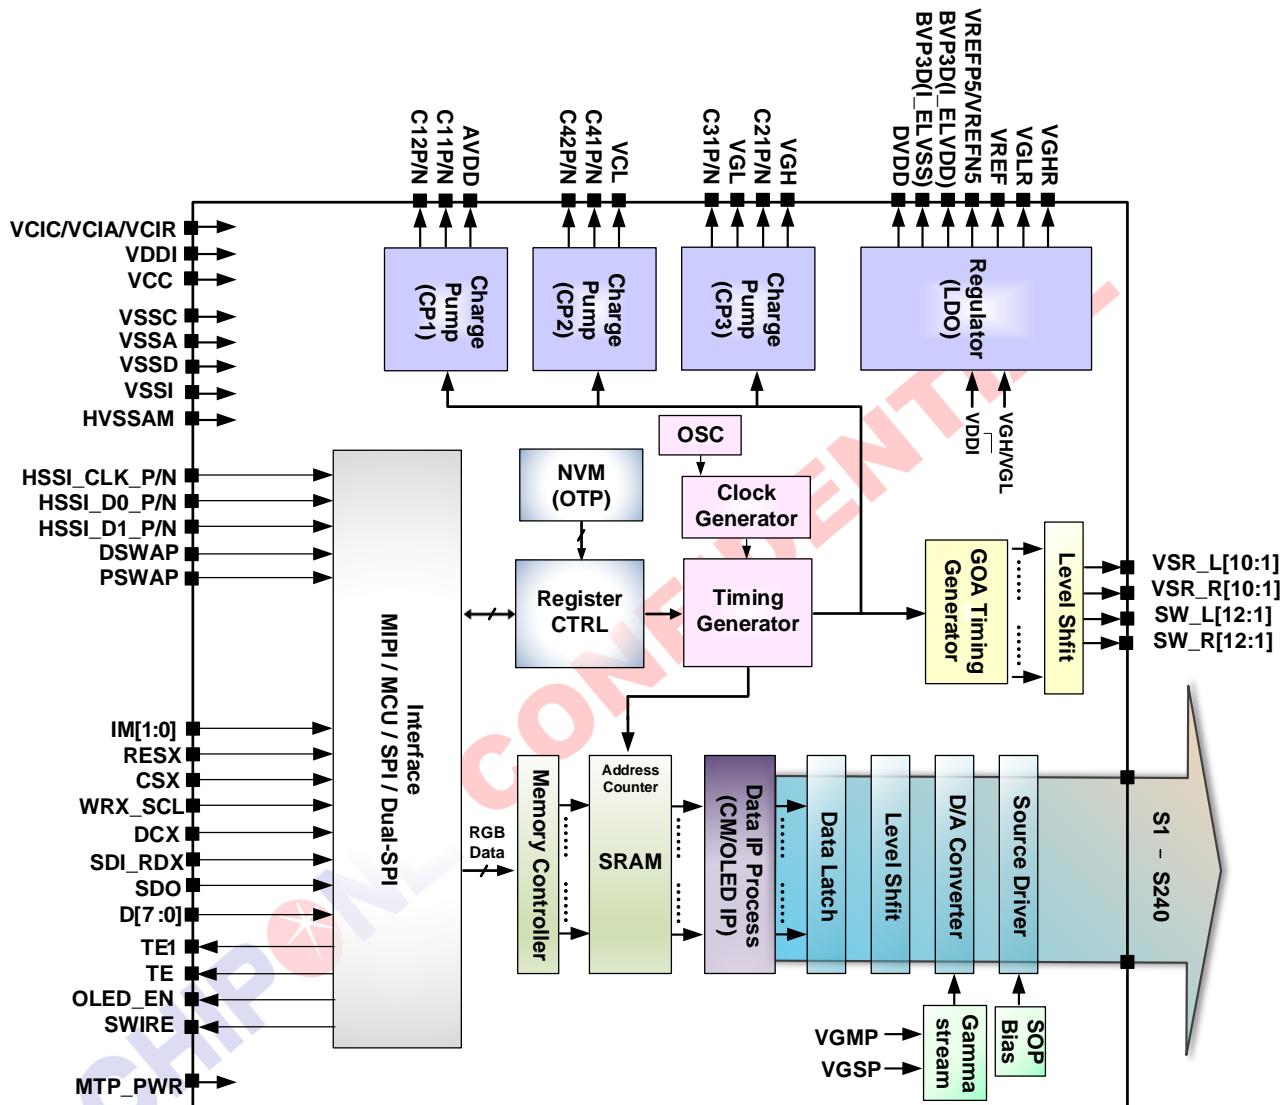

- Positive gate driver voltage range for VGHR: AVDD ~ 10.6V, step 0.2V
- Negative gate driver voltage range for VGLR: VCL ~ -15V, step 0.2V
- VREFP panel voltage range: 0.5~5V, step 0.1V (Max<=AVDD-0.3V)
- VREFN panel voltage range: -0.5~-5V, step 0.1V (Min>=VCL+0.3V)
- Step-up 1,2 output voltage range for
AVDD: 4.5 ~ 6.5V, step 0.1V; VCL: -3.5 ~ -5.0V, step 0.5V
- Gamma high/low voltage range for
VGMP: 2.0V ~ 6.3V, step 12.5mV , VGSP: 0.2125V ~ 4.5V, step 12.5mV

■ **Package: COF**

■ **Chip size evaluation : 7640um x 1670um(including scribe line)**

3. Device Overview

3.1 Block diagram

CO5300 Block diagram

4. Pin Description

4.1 Pins for Power Input

| Symbol | I/O Type | Description |
|---------|--------------|---|
| VCIC | Power Supply | <ul style="list-style-type: none"> - Power supply to DCDC power for DDIC use. - It can be supported by "external PMIC". - VCIC= 2.7V ~ 3.6V. - VCIC, VCIA, VCIR should be the same input voltage level to system VCI. |
| VCIA | Power Supply | <ul style="list-style-type: none"> - Power supply to analog power for DDIC use. - It can be supported by "external PMIC". - VCIA= 2.7V ~ 3.6V. - VCIC, VCIA, VCIR should be the same input voltage level to system VCI. |
| VCIR | Power Supply | <ul style="list-style-type: none"> - Power supply to LDO for DDIC use. - It can be supported by "external PMIC". - VCIR= 2.7V ~ 3.6V. - VCIC, VCIA, VCIR should be the same input voltage level to system VCI. |
| VDDI | Power Supply | <ul style="list-style-type: none"> - Power supply to I/O. - VDDI= 1.65V ~ 3.3V. |
| VCC | Power Supply | <ul style="list-style-type: none"> - Power supply for DVDD regulator. - In case of COF, connect VCC to VDDI on the FPC. |
| VSSC | Power GND | <ul style="list-style-type: none"> - Ground for DC/DC converter. VSSC=0V. |
| VSSA | Power GND | <ul style="list-style-type: none"> - Ground for analog system. VSSA=0V. - In case of COF, connect VSSA to VSS on the FPC to prevent noise. |
| HVSSAM | Power GND | <ul style="list-style-type: none"> - Ground for MIPI interface. - In case of COF, connect HVSSAM to system VSS on the FPC to prevent noise. |
| VSSI | Power GND | <ul style="list-style-type: none"> - Ground for I/O except MIPI interface. - In case of COF, connect VSSI to system VSS on the FPC to prevent noise. |
| VSSD | Power GND | <ul style="list-style-type: none"> - Ground for internal digital system. VSSD=0V. - In case of COF, connect VSSD to system VSS on the FPC to prevent noise. |
| MTP_PWR | Power Supply | <ul style="list-style-type: none"> - MTP programming power supply pin. (8.25V typical) - Must be left open or connected to VSSD in normal condition. |

4.2 Pins for QSPI Interface

| Symbol | I/O Type | Description |
|---------|---------------------------------|--|
| CSX | Digital Input (VDDI - VSSI) | <ul style="list-style-type: none"> - Chip select input pin ("Low" enable) in QSPI I/F. - If not used, please connect to VDDI. |
| WRX_SCL | Digital Input (VDDI - VSSI) | <ul style="list-style-type: none"> - SCL: A synchronous clock signal in QSPI I/F. - If not used, please connect to VSSI. |
| D/CX | Digital Input (VDDI - VSSI) | <ul style="list-style-type: none"> - Display data / command selection in QSPI I/F. D/CX = "0" : Command D/CX = "1" : Display data or Parameter - If not used, please connect to VSSI. |
| SDI_RDX | Digital I/O (VDDI - VSSI) | <ul style="list-style-type: none"> - SDI: Serial input signal in QSPI I/F. The data is input on the rising edge of the SCL signal. - If not used, please open this pin. |
| SDO | Digital Output (VDDI - VSSI) | <ul style="list-style-type: none"> - Serial output signal in QSPI I/F. The data is output on the rising/falling edge of the SCL signal. If the host places the SDI line into high-impedance state during the read interval, the SDI and SDO can be tied together. - If not used, please open this pin. |
| D[7:0] | Digital I/O (VDDI - VSSI) | <ul style="list-style-type: none"> - 8-bit bi-directional data bus for RGB I/F. - These pins are not used for SPI, MIPI, please open this pin. |

4.3 Pins for MIPI Interface

| Symbol | I/O Type | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|--------------------------------|--|------------|-------------|-------------|------------|-------------|-------------|------------|------------|---|---|-----|-----|------|------|-----|-----|---|---|-----|-----|------|------|-----|-----|---|---|-----|-----|------|------|-----|-----|---|---|-----|-----|------|------|-----|-----|
| HSSI_CLK_P HSSI_CLK_N | MIPI Input | <ul style="list-style-type: none"> - DS1 CLK+/- differential clock signals. - HSSI_CLK_P/N are differential signals. To be ensure the trace length is shortest so that COF and FPC resistance is less than 10 Ohm. - For MIPI I/F, please pull HSSI_CLK_P/N to LP-00 or VSSI when enter deep standby mode. - If not used, please connect these pins to HVSSAM. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| HSSI_D0_P HSSI_D0_N | MIPI I/O | <ul style="list-style-type: none"> - DS1 D0+/- differential clock signals. - HSSI_D0_P/N are differential signals. To be ensure the trace length is shortest so that COF and FPC resistance is less than 10 Ohm. - For MIPI I/F, please pull HSSI_D0_P/N to LP-00 or VSSI when enter deep standby mode. - If not used, please connect these pins to HVSSAM. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| HSSI_D1_P HSSI_D1_N | MIPI I/O | <ul style="list-style-type: none"> - DS1 D1+/- differential clock signals. - HSSI_D1_P/N are differential signals. To be ensure the trace length is shortest so that COF and FPC resistance is less than 10 Ohm. - For MIPI I/F, please pull HSSI_D1_P/N to LP-00 or VSSI when enter deep standby mode. - If not used, please connect these pins to HVSSAM. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PSWAP DSWAP | Digital Input (VDDI - VSSI) | <ul style="list-style-type: none"> - Input pin to select HSSI_D0/D1 data lane sequence and polarity in high speed interface only. <table border="1" style="margin-top: 10px; width: 100%; text-align: center;"> <thead> <tr> <th>PSWAP</th><th>DSWAP</th><th>HSSI_D_0_P</th><th>HSSI_D_0_N</th><th>HSSI_C_LK_P</th><th>HSSI_C_LK_N</th><th>HSSI_D_1_P</th><th>HSSI_D_1_N</th></tr> </thead> <tbody> <tr> <td>0</td><td>0</td><td>D0+</td><td>D0-</td><td>CLK+</td><td>CLK-</td><td>D1+</td><td>D1-</td></tr> <tr> <td>0</td><td>1</td><td>D1+</td><td>D1-</td><td>CLK+</td><td>CLK-</td><td>D0+</td><td>D0-</td></tr> <tr> <td>1</td><td>0</td><td>D0-</td><td>D0+</td><td>CLK-</td><td>CLK+</td><td>D1-</td><td>D1+</td></tr> <tr> <td>1</td><td>1</td><td>D1-</td><td>D1+</td><td>CLK-</td><td>CLK+</td><td>D0-</td><td>D0+</td></tr> </tbody> </table> <p>- If not used, please connect to VSSI.</p> | PSWAP | DSWAP | HSSI_D_0_P | HSSI_D_0_N | HSSI_C_LK_P | HSSI_C_LK_N | HSSI_D_1_P | HSSI_D_1_N | 0 | 0 | D0+ | D0- | CLK+ | CLK- | D1+ | D1- | 0 | 1 | D1+ | D1- | CLK+ | CLK- | D0+ | D0- | 1 | 0 | D0- | D0+ | CLK- | CLK+ | D1- | D1+ | 1 | 1 | D1- | D1+ | CLK- | CLK+ | D0- | D0+ |

5. Function Description

5.1 Interface Selection

The CO5300 provides Interface type selection, which is determined by hardware connection pins of IM[1:0] as shown in table are below.

| IM[1:0] | Display Data | Command |
|---------|-----------------|-----------------|
| 00 | MIPI | MIPI |
| 01 | MIPI | MIPI |
| 10 | MIPI / QUAD-SPI | MIPI / QUAD-SPI |

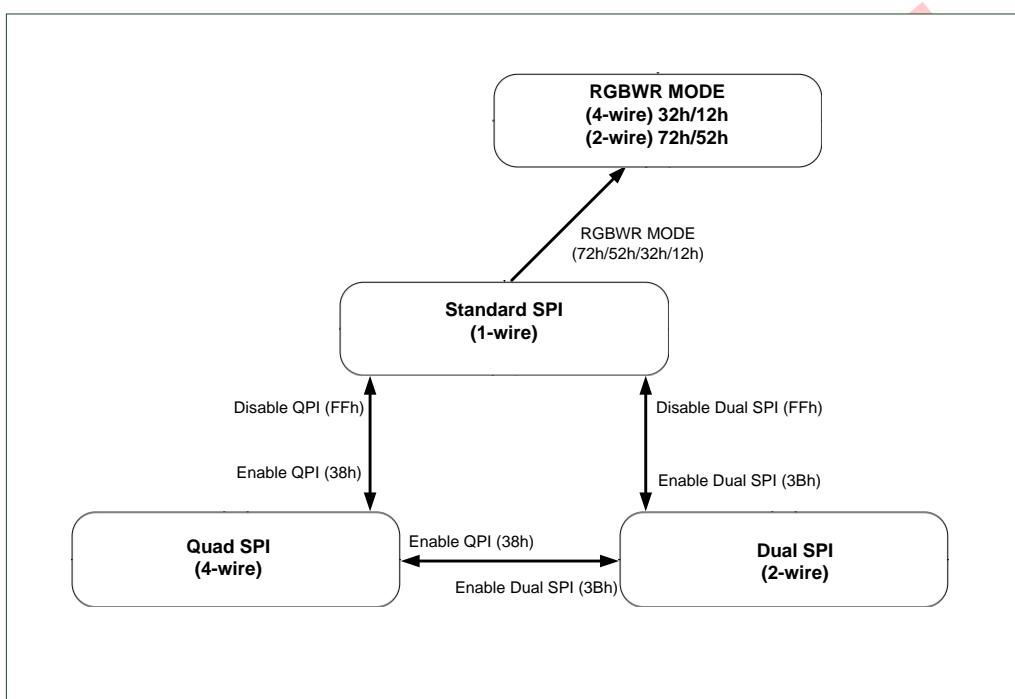

CHIPONE CONFIDENTIAL

5.2 QUAD SPI Interface

CO5300 would support QUAD SPI interface (Refer to the below figures). QUAD SPI provides 1-wire for writing / reading command, and 4-wire for writing pixel data. CSX is the chip selection and it is low active property. SCL is driven from high to low then pulled back to high during the write cycle. The host processor provides information during the write cycle while the display module reads the host processor information on the rising edge of SCL.

5.2.1 QUAD SPI command format

The QUAD SPI interface contains three operating modes, Standard SPI, Dual SPI and Quad SPI. These modes structure as below.

The QUAD SPI interface instruction code as below:

| Instruction code | Description |
|------------------|-------------------------------------|
| 0xFF | Reset dual & quad SPI to single SPI |
| 0x3B | Enter dual SPI |
| 0x38 | Enter quad SPI |
| 0x02 | Command / pixel write |
| 0x03 | Command / pixel read |
| 0x32 | 4-wire pixel write (address: 24clk) |
| 0x12 | 4-wire pixel write (address: 6clk) |
| 0x72 | 2-wire pixel write (address: 24clk) |
| 0x52 | 2-wire pixel write (address: 12clk) |

5.2.2 Write Cycle and Sequence

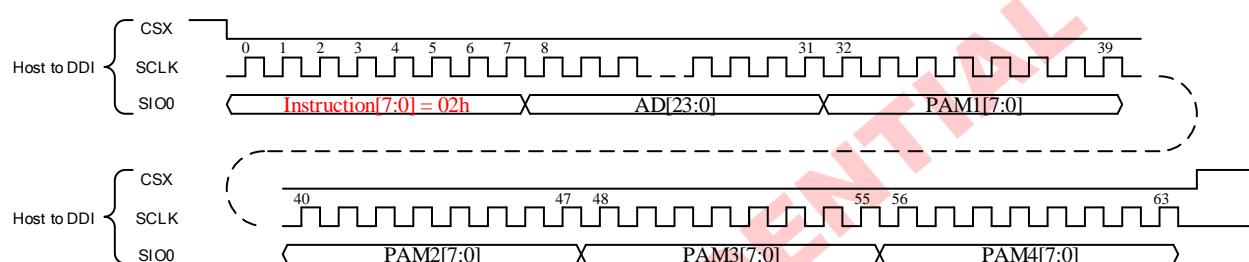

The QUAD SPI interface write command sequences are described in the following figure as below.

QSPI write protocol contain as below :

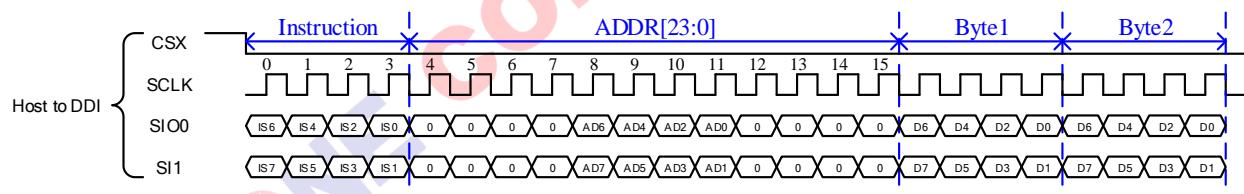

Instruction[7:0] = 02h
AD[23:0] = {8'h00, CMD[7:0], 8'h00}
PAM[7:0]

Command write
Driver IC command address
Driver IC parameters

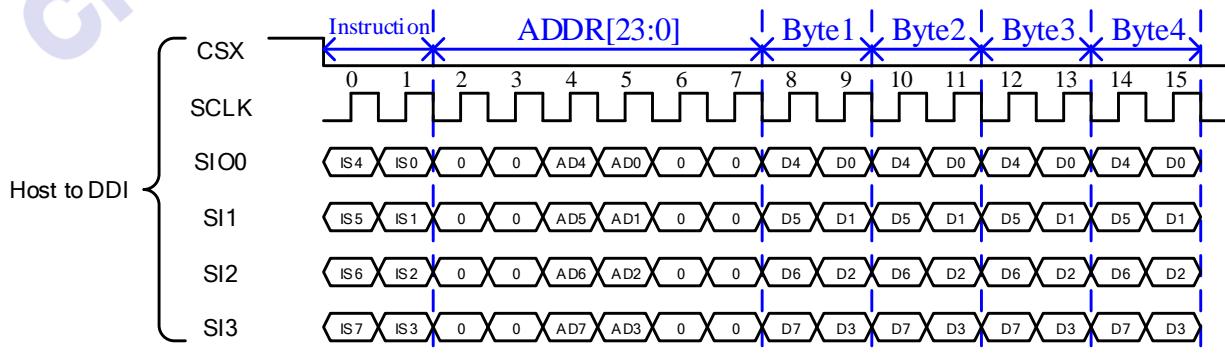

QSPI 1-wire write

QSPI 2-wire write

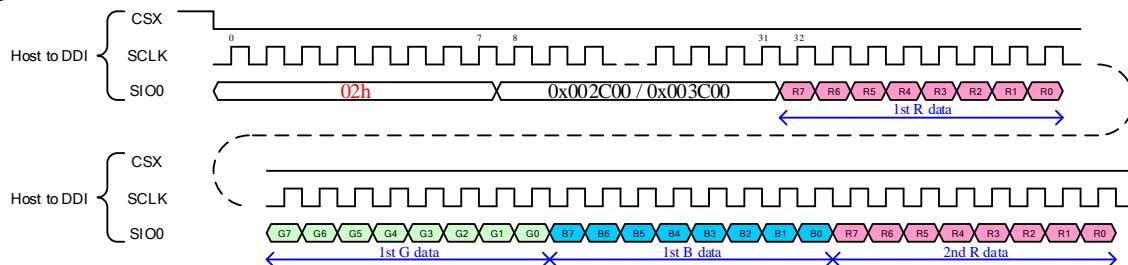

QSPI 4-wire write

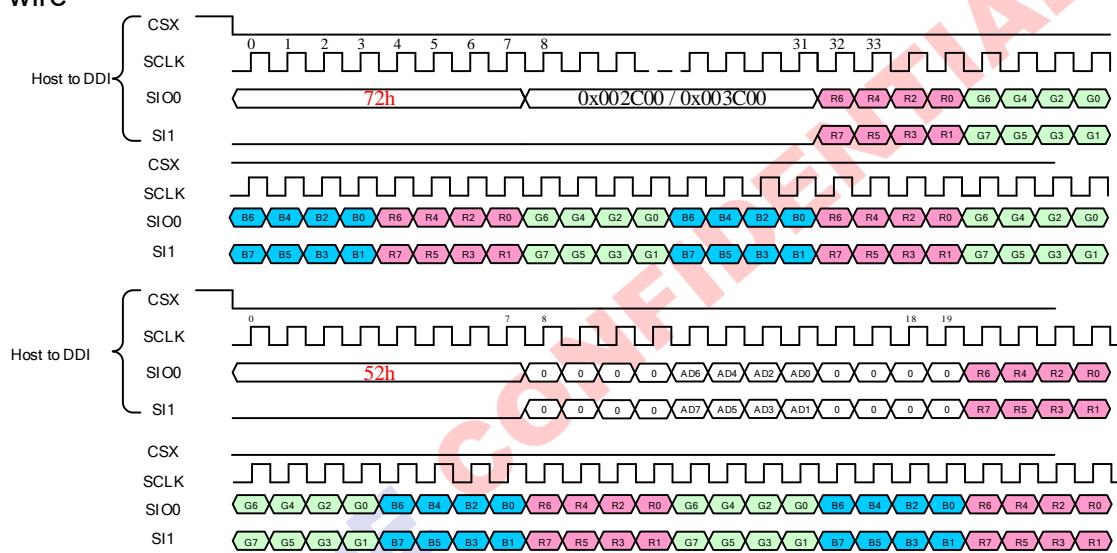

The QUAD SPI interface supports different display data formats with six color depths, RGB888, RGB666, RGB565, RGB332, RGB111, GRAY256.

RGB888:

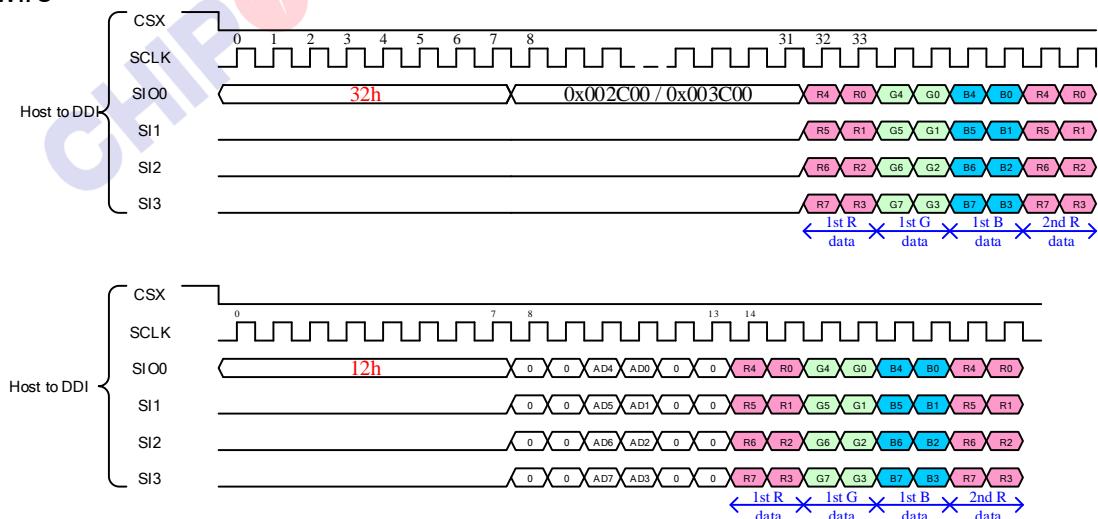

1-wire

2-wire

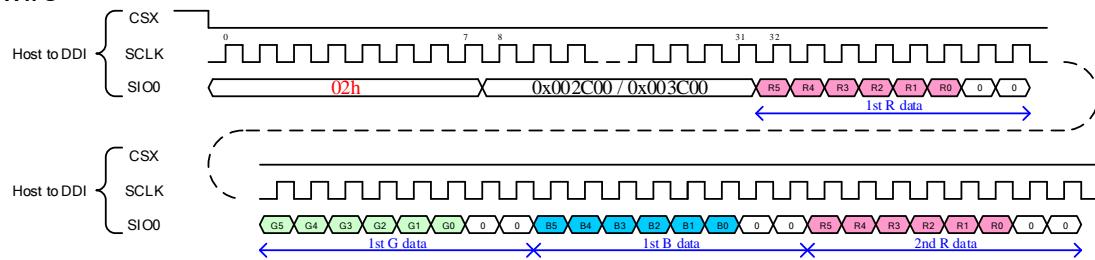

4-wire

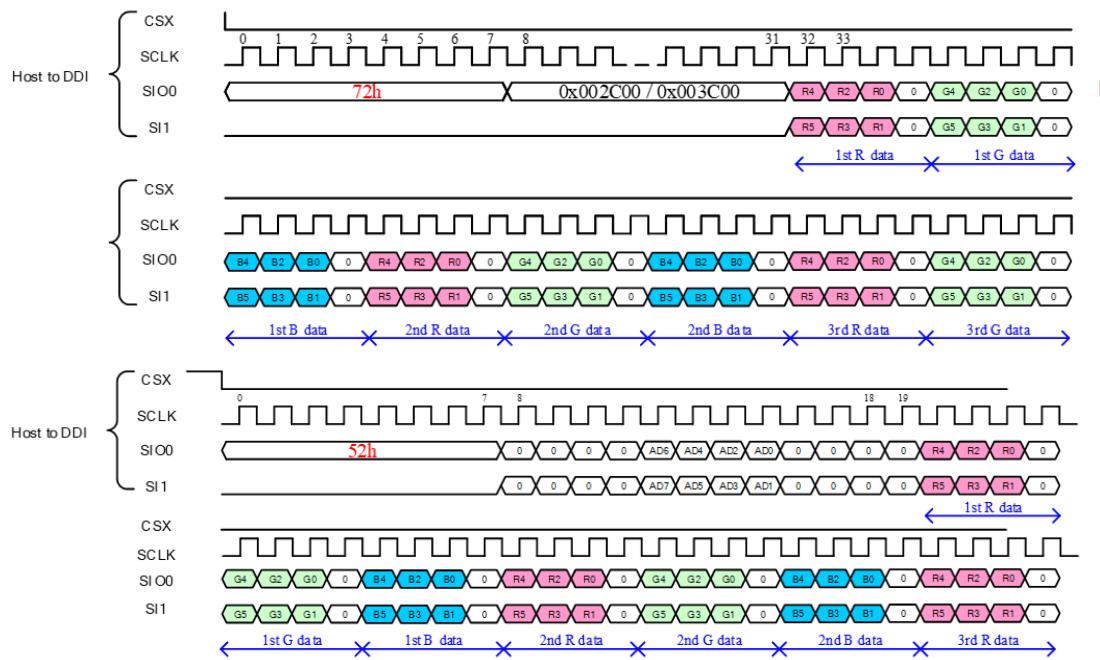

RGB666:

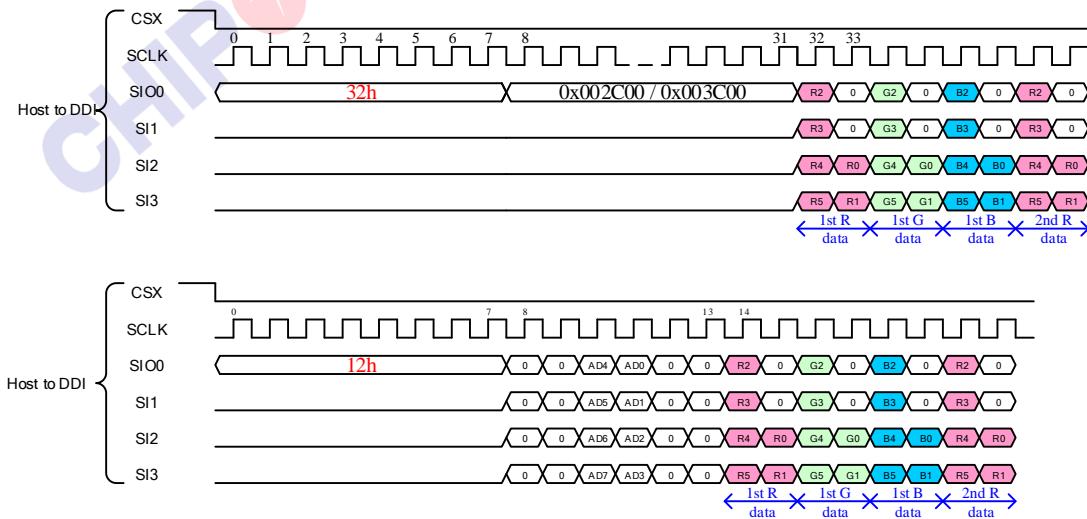

1-wire

2-wire

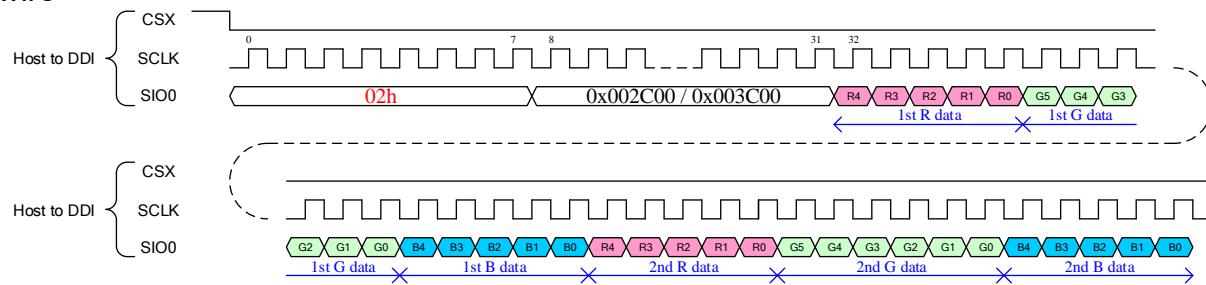

4-wire

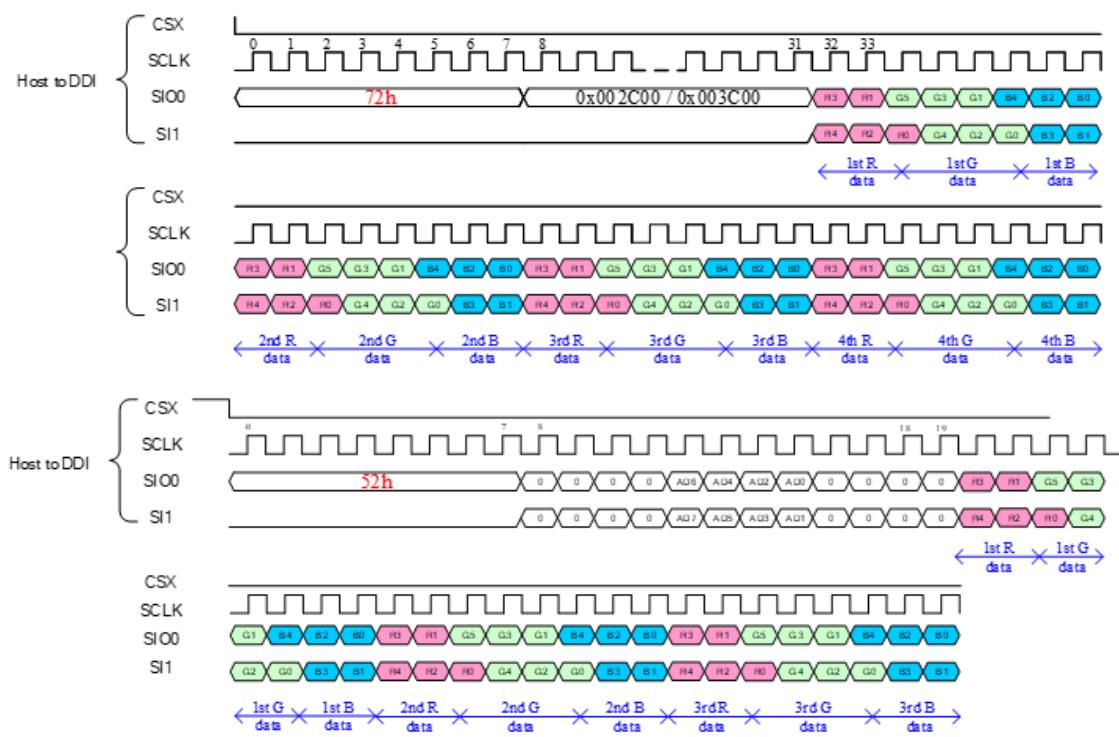

RGB565:

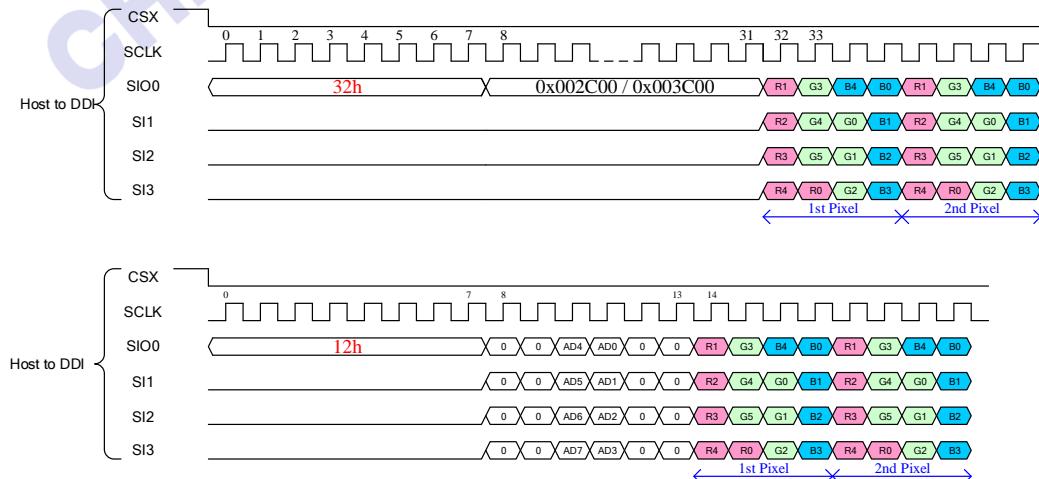

1-wire

2-wire

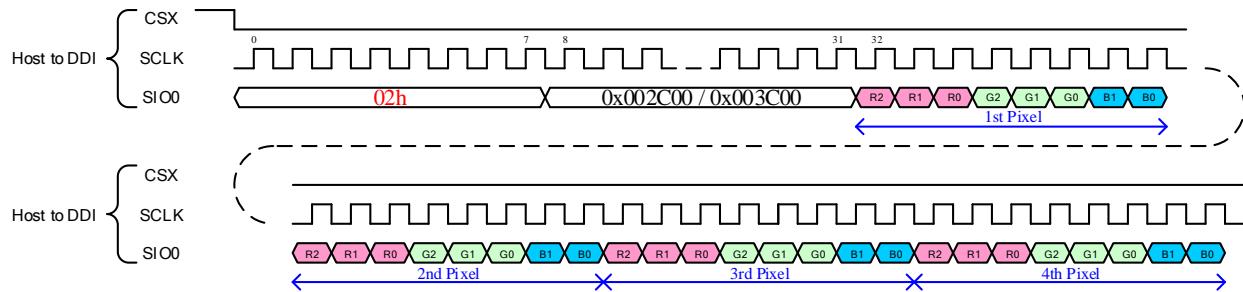

4-wire

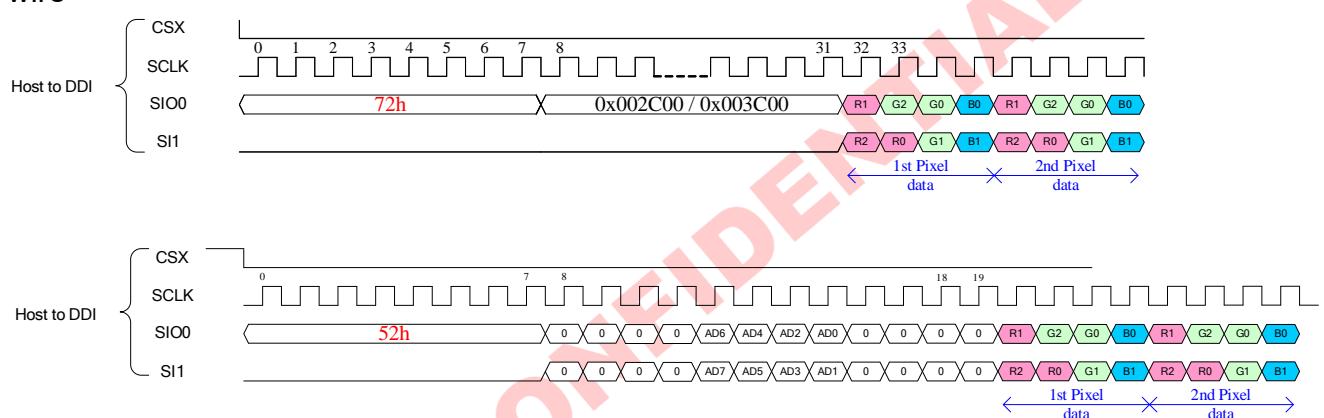

RGB332:

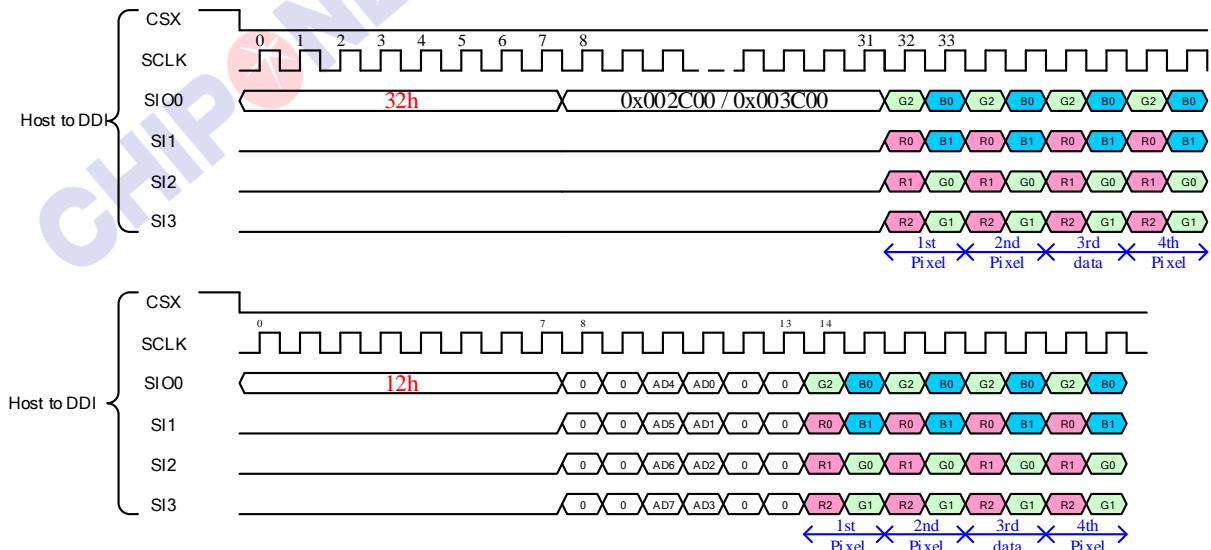

1-wire

2-wire

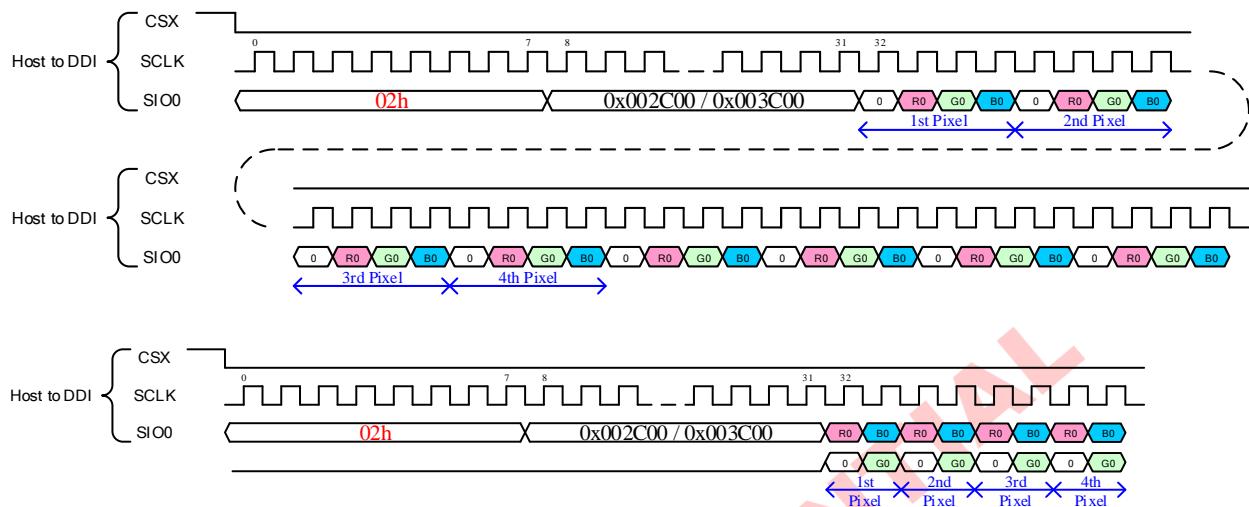

4-wire

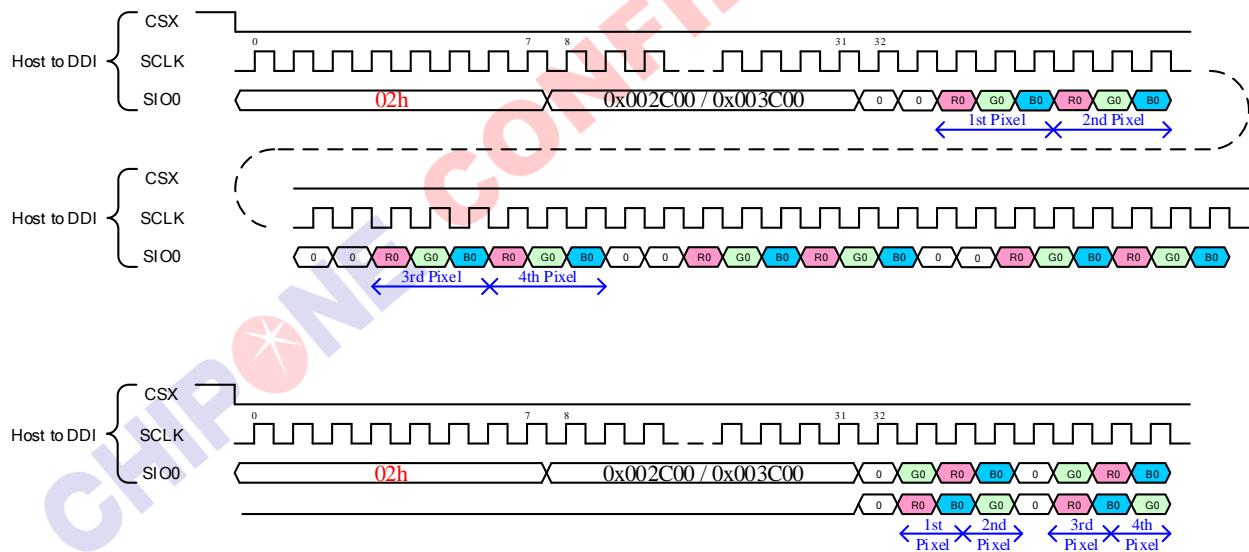

RGB111:

0RGB0RGB

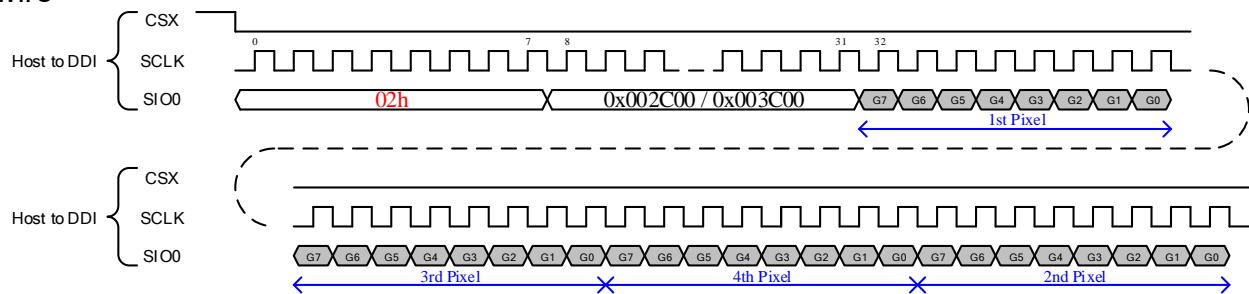

00RGBRGB

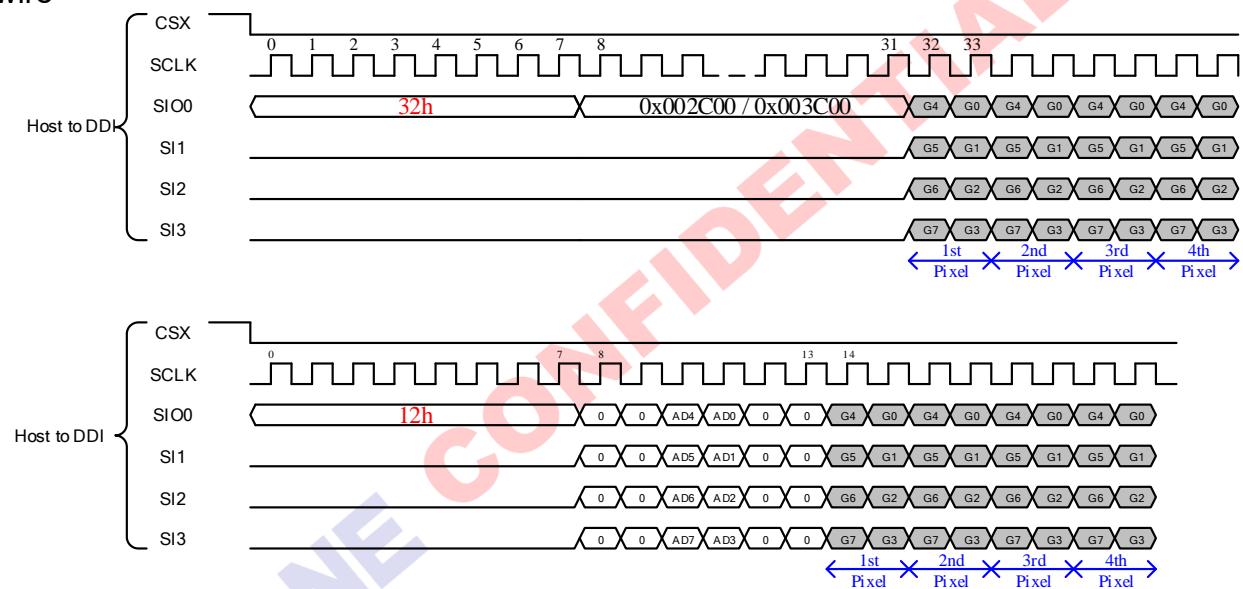

GRAY256:

1-wire

4-wire

5.2.3 Read Cycle and Sequence

The QUAD SPI interface read mode are described in the following figure as below.

Instruction[7:0] = 03h

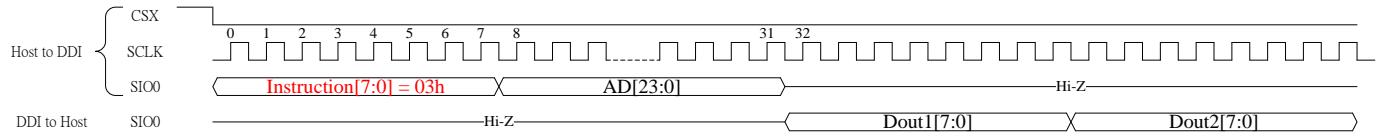

AD[23:0] = {8'h00, CMD[7:0], 8'h00}

Dout[7:0]

Command read

Driver IC command address

Driver IC output to host

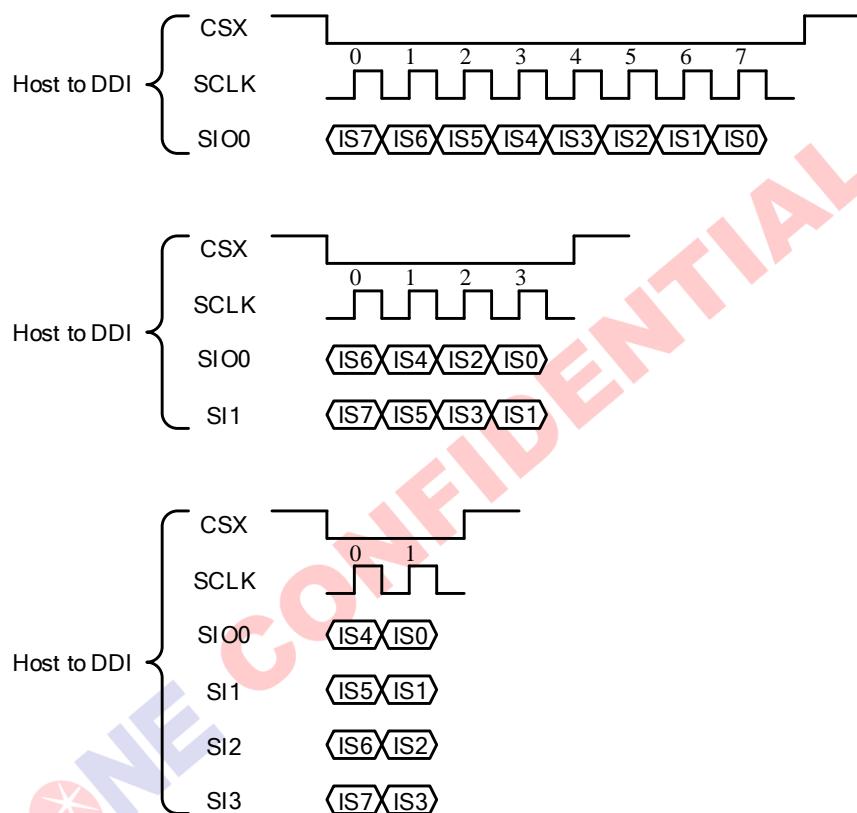

5.2.4 QUAD SPI Function

1. work mode change

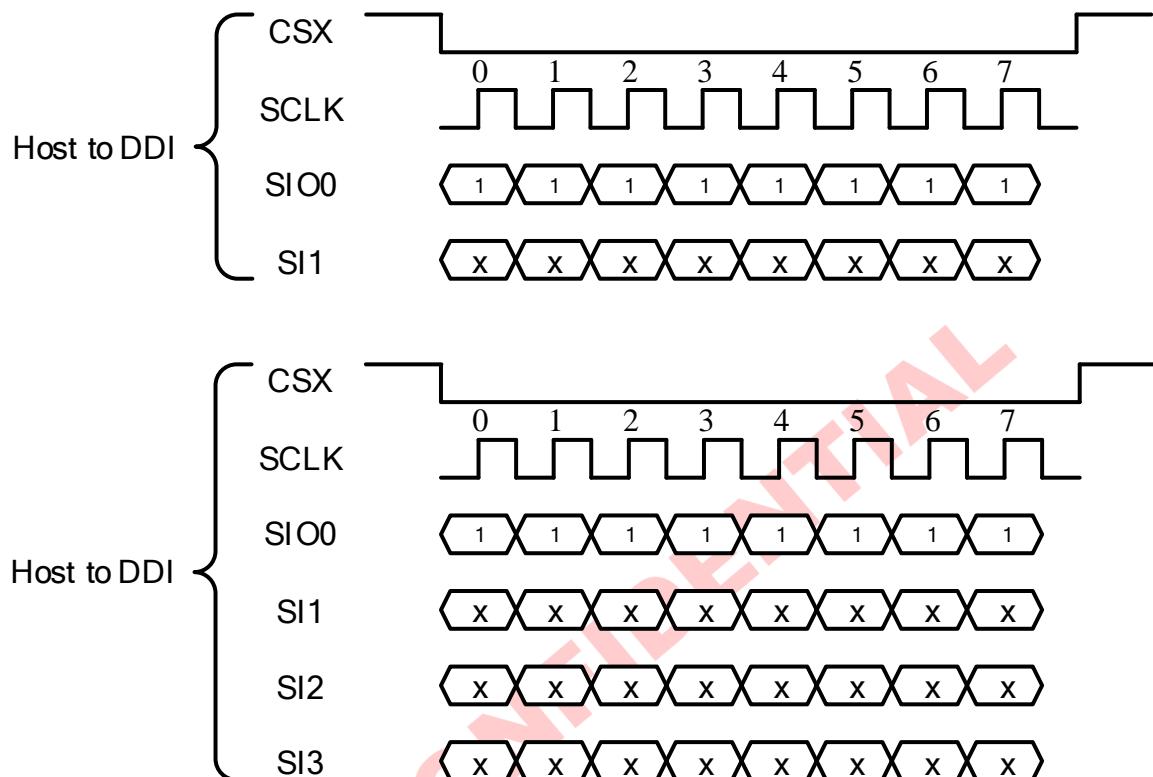

The QUAD SPI interface utilizes CSX, SCL, SIO0, SI1, SI2 and SI3 signals. SCL is driven from high to low then pulled back to high during the write cycle. The host processor provides information during the write cycle while the display module reads the host processor information on the rising edge of SCL.

The QUAD SPI interface Send instruction in current mode to change to new mode.

2. Reset Function

If the host is operating in 1-wire SPI protocol and the driver IC is operating in 2-wire or 4-wire SPI protocol, then the DDIC interface is reset to 1-wire SPI.

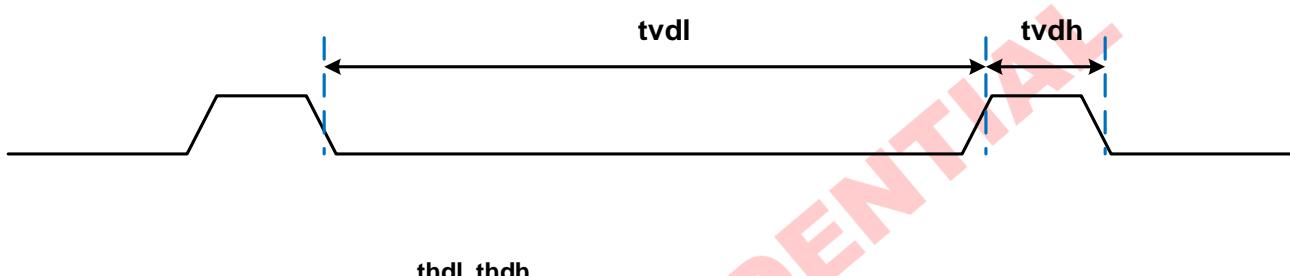

5.3 Tearing Effect Output

The tearing effect output line supplies to the HOST a panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line off and on commands. The mode of the tearing effect signal is defined by the parameter of the set_tear_on (35h) and set_tear_scanline(44h) commands. The signal can be used by the HOST to synchronize internal VSYNC when displaying video images.

5.3.1 Tearing Effect Line Mode

Mode 1,

The tearing effect output signal consist of V-sync and V-Blanking information only:

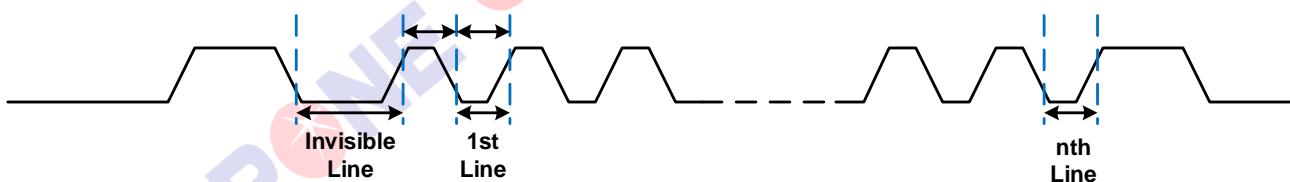

thdh = The LCD display is not updated from the frame memory.

tvdl = The LCD display is updated from the frame memory.

Mode 2,

The tearing effect output signal consist of V-Blanking and H-Blanking which are included of V-sync and H-sync information:

thdh = The display is not updated from the frame memory.

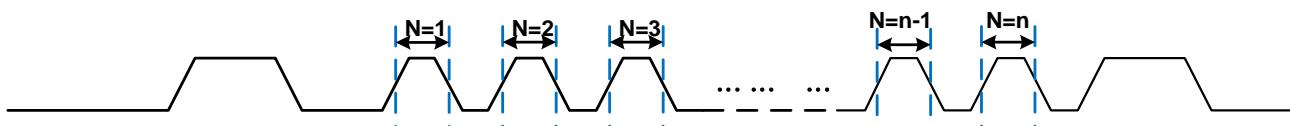

thdl = The display is updated from the frame memory.

n = Vertical scanning resolution

Mode 3,

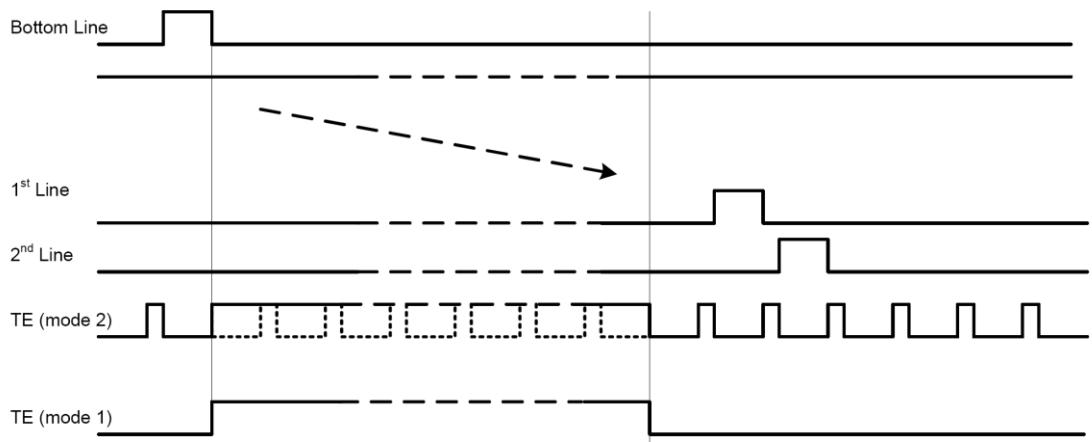

This mode turn on the tearing effect output signal when vertical scanning reaches line N.

In below figure, it shows that TE only output one line period pulse that can be selected from 2nd line to 1280th line by register 44h.

N = The N-th scanning line which set by register N[15:0] of command STESL(44h).

n = Vertical scanning resolution

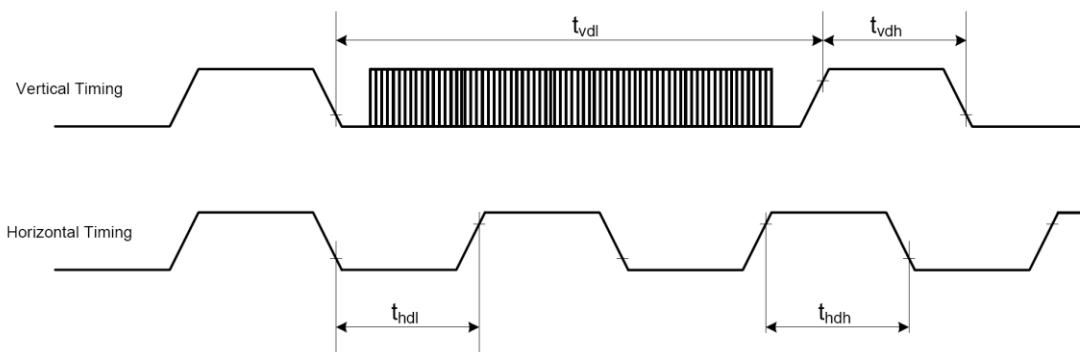

Note. During Sleep In mode, the tearing effect output signal is active low.

CHIPONE CONFIDENTIAL

5.3.2 Tearing Effect Line Timing

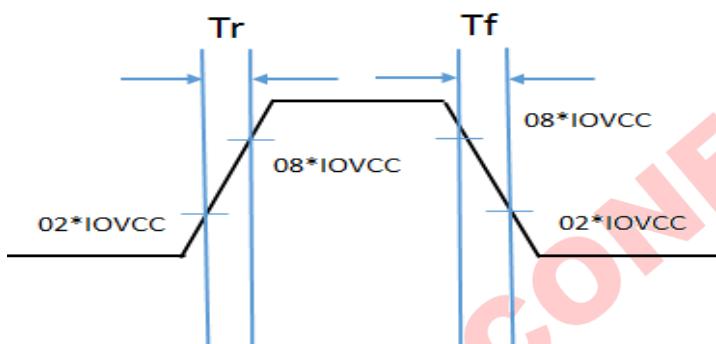

The tearing effect signal is described as below:

AC characteristics of Tearing Effect Signal (Frame Rate = 60Hz)

Notes:

The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the HOST and should be used as shown below to avoid tearing effect:

The below is described TE output Position by Register 35h and 44h.

| Reg. 35h | Reg. 44h | TE Output Position |
|----------|----------|---|
| M | N | TE Output Position |
| 0 | 0 | TE high in V-porch region including of VBP and VFP for TE mode 1 |
| 1 | 0 | TE high in all V-porch including of VBP and VFP/H-porch including of HBP and HFP region for TE mode 2 |
| 0 | $\neq 0$ | TE high at N-th line for TE mode 3 |
| 1 | $\neq 0$ | TE high in all V-porch including of VBP and VFP/H-porch including of HBP and HFP region for TE mode 2 |

5.4 Display Serial Interface (DSI) MIPI Interface

5.4.1 Interface Level Communication

5.4.1.1 General

The display module uses data and clock lane differential pairs for DSI (DSI-1M). Both differential lane pairs can be driven to Low Power (LP) or High Speed (HS) mode. Low Power mode means that each line of the differential pair is used in the single ended mode, a differential receiver is disable (a termination resistor of the receiver is disable), and it can be driven into a low power mode.

High Speed mode means that differential pairs (the termination resistor of the receiver is enable) are not used in the single ended mode.

Different modes and protocols are used in each mode when transferring information from the MCU to the display module and vice versa.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair are defined below.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair define

| Lane Pair State Code | Line DC Voltage Levels | | High Speed (HS) | Low Power | |
|----------------------|------------------------|-----------|------------------|--------------|-------------|
| | DATA_P | DATA_N | Burst Mode | Control Mode | Escape Mode |
| HS-0 | Low (HS) | High (HS) | Differential - 0 | Note1 | Note1 |
| HS-1 | High (HS) | Low (HS) | Differential – 1 | Note1 | Note1 |
| LP-00 | Low (LP) | Low (LP) | Not Defined | Bridge | Space |
| LP-01 | Low (LP) | High (LP) | Not Defined | HS-Request | Mark-0 |
| LP-10 | High (LP) | Low (LP) | Not Defined | LP-Request | Mark-1 |
| LP-11 | High (LP) | High (LP) | Not Defined | Stop | Note 2 |

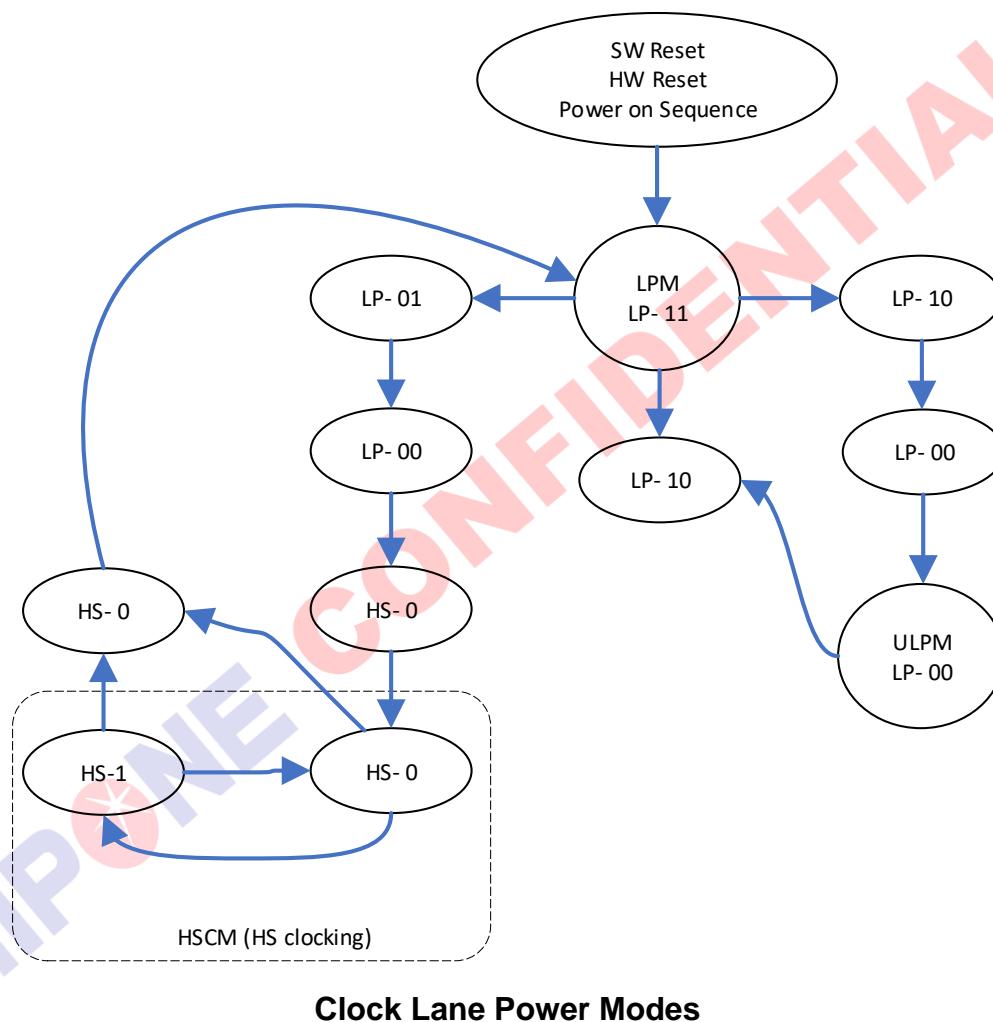

Note 1: Low-Power Receivers (LP-Rx) of the lane pair will check the LP-00 state code when the Lane Pair is in the High Speed (HS) mode.

Note 2 : If Low-Power Receivers (LP-Rx) of the lane pair recognizes the LP-11 state code, then the lane pair will return to LP-11 of the Control Mode.

Note 3: n = 0, and 1(D1P/N, and D2 P/N lanes only for HS-0 and HS-1).

5.4.1.2 DS1 CLK Lanes

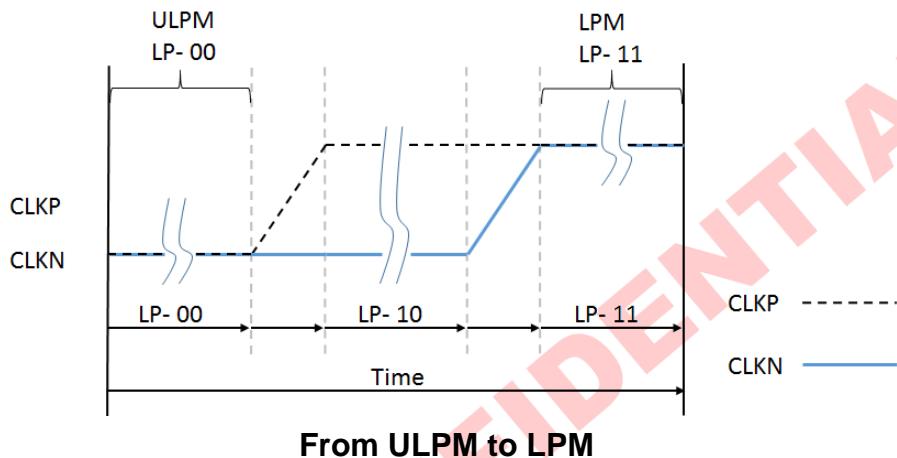

CLKP/N lanes can be driven into three different power modes: Low Power Mode (LPM), Ultra-Low Power Mode (ULPM) and High Speed Clock Mode (HSCM). Clock lane is in the single ended mode (LP = Low Power) when entering or leaving Low Power Mode (LPM) or Ultra-Low Power Mode (ULPM). Clock lane is in the single ended mode (LP = Low Power) when entering in or leaving High Speed Clock Mode (HSCM). These entering and leaving protocols use Clock lane in the single ended mode to generate an entering or leaving sequence. The principal flow chart of the different Clock lane power modes is illustrated below.

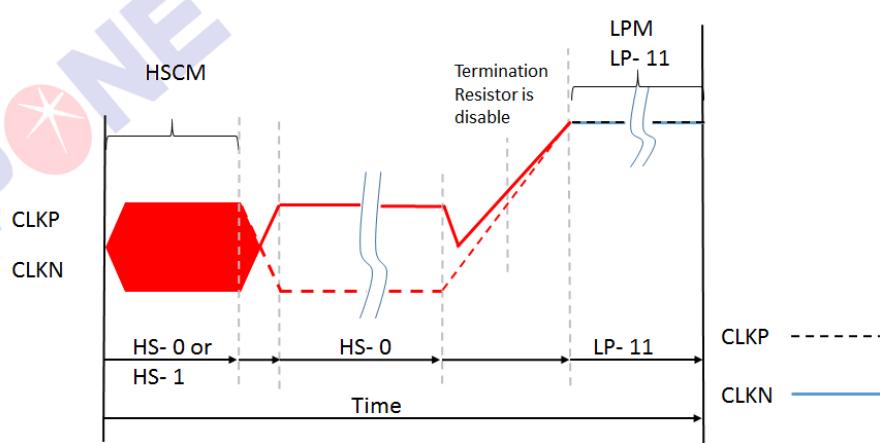

5.4.1.3 Low Power Mode (LPM)

CLKP/N lanes can be driven to the Low Power Mode (LPM), when CLKP/N lanes enter LP-11 State Code, in three different ways:

- 1) After SW Reset, HW Reset or Power On Sequence => LP-11.
- 2) After CLKP/N lanes leave Ultra-Low Power Mode (ULPM, LP-00 State Code) => LP-10 => LP-11 (LPM). This sequence is illustrated below.

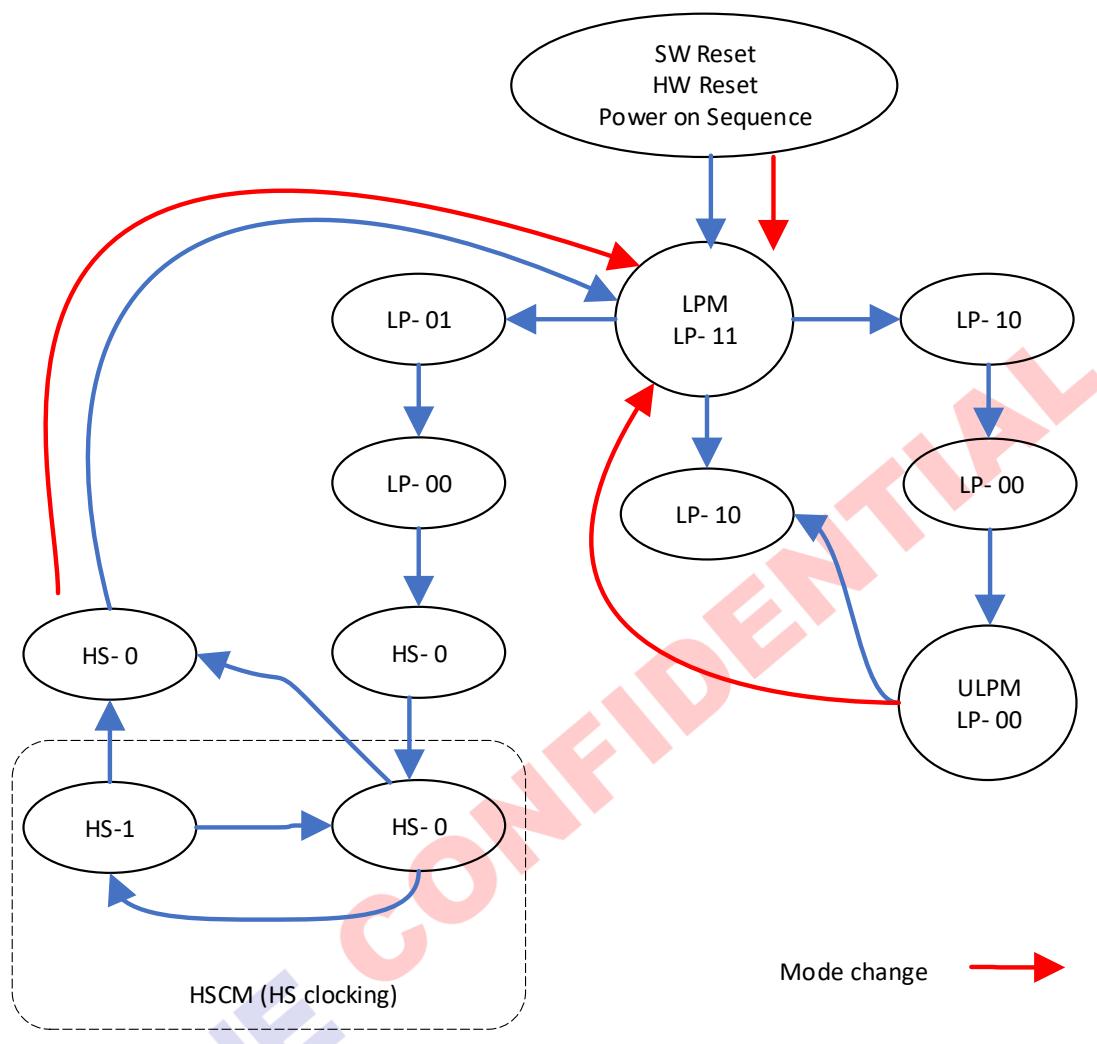

- 3) After CLKP/N lanes leave High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) => HS-0=> LP-11 (LPM). This sequence is illustrated below.

From High Speed Clock Mode (HSCM) to LPM

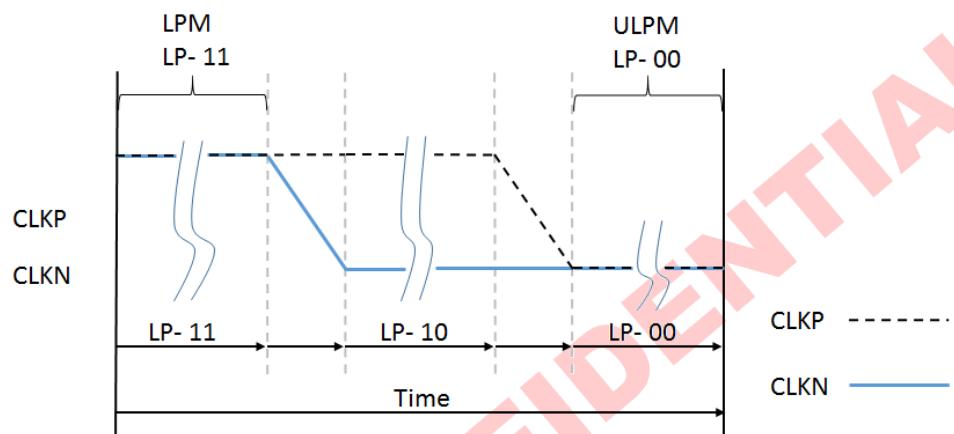

The changes of all the three modes are illustrated in the flow chart below.

5.4.1.4 Ultra- Low Power Mode (ULPM)

CLKP/N lanes can be driven to the Ultra- Low Power Mode (ULPM), when CLKP/N lanes enter LP-11 State Code, in three different ways:

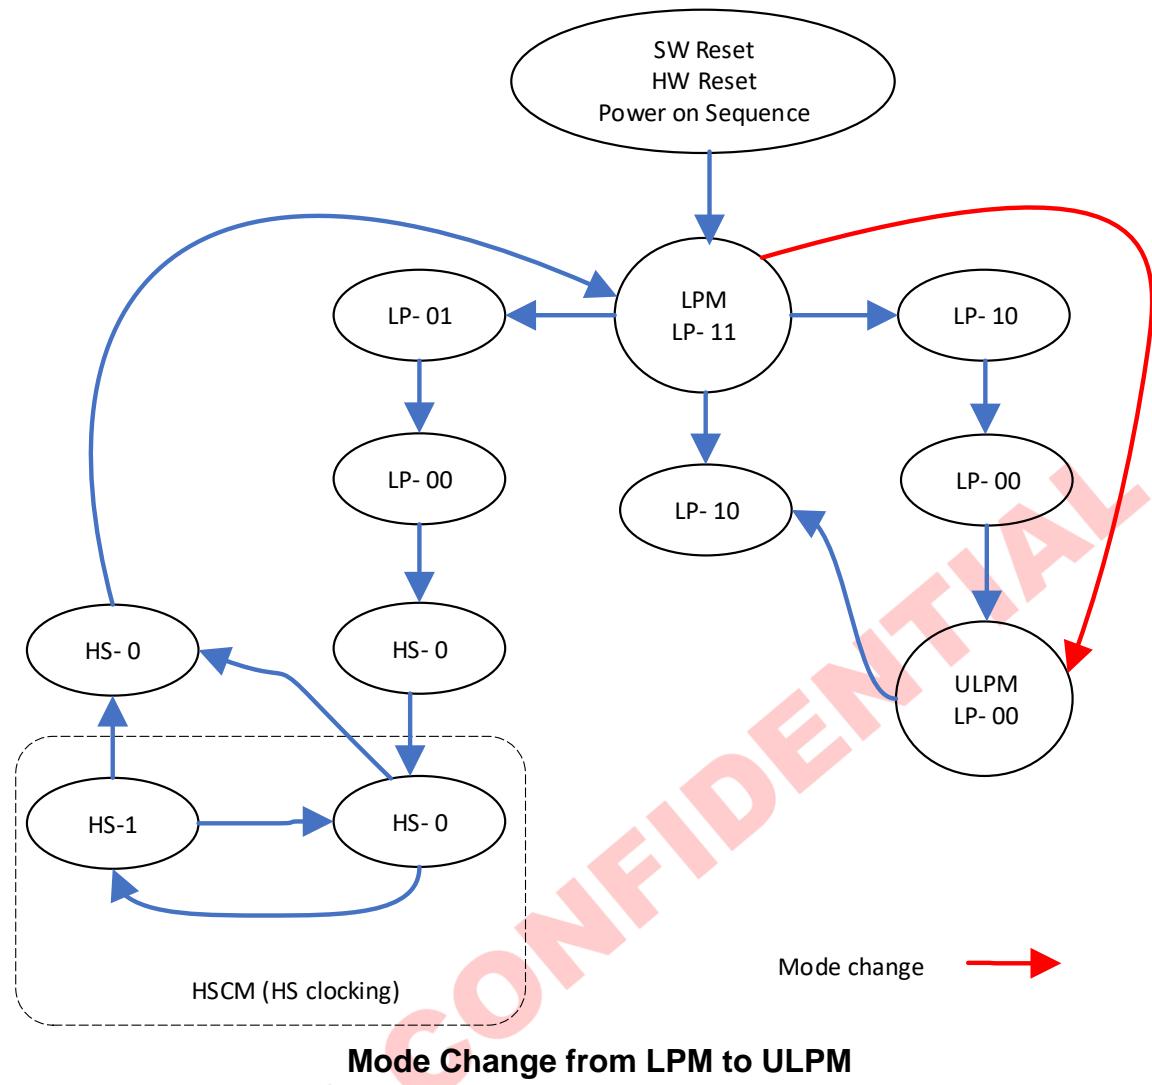

- 1) After SW Reset, HW Reset or Power On Sequence => LP-11.
- 2) After CLKP/N lanes leave Low Power Mode (LPM, LP-11 State Code) => LP-10 => LP-00 (ULPM). This sequence is illustrated below.

From LPM to ULPM

The mode change is also illustrated below.

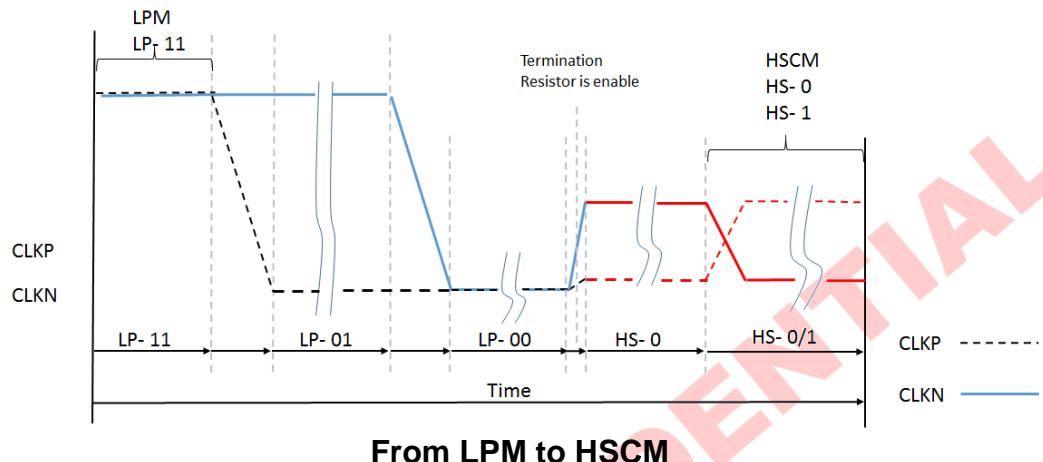

5.4.1.5 High-Speed Clock Mode (HSCM)

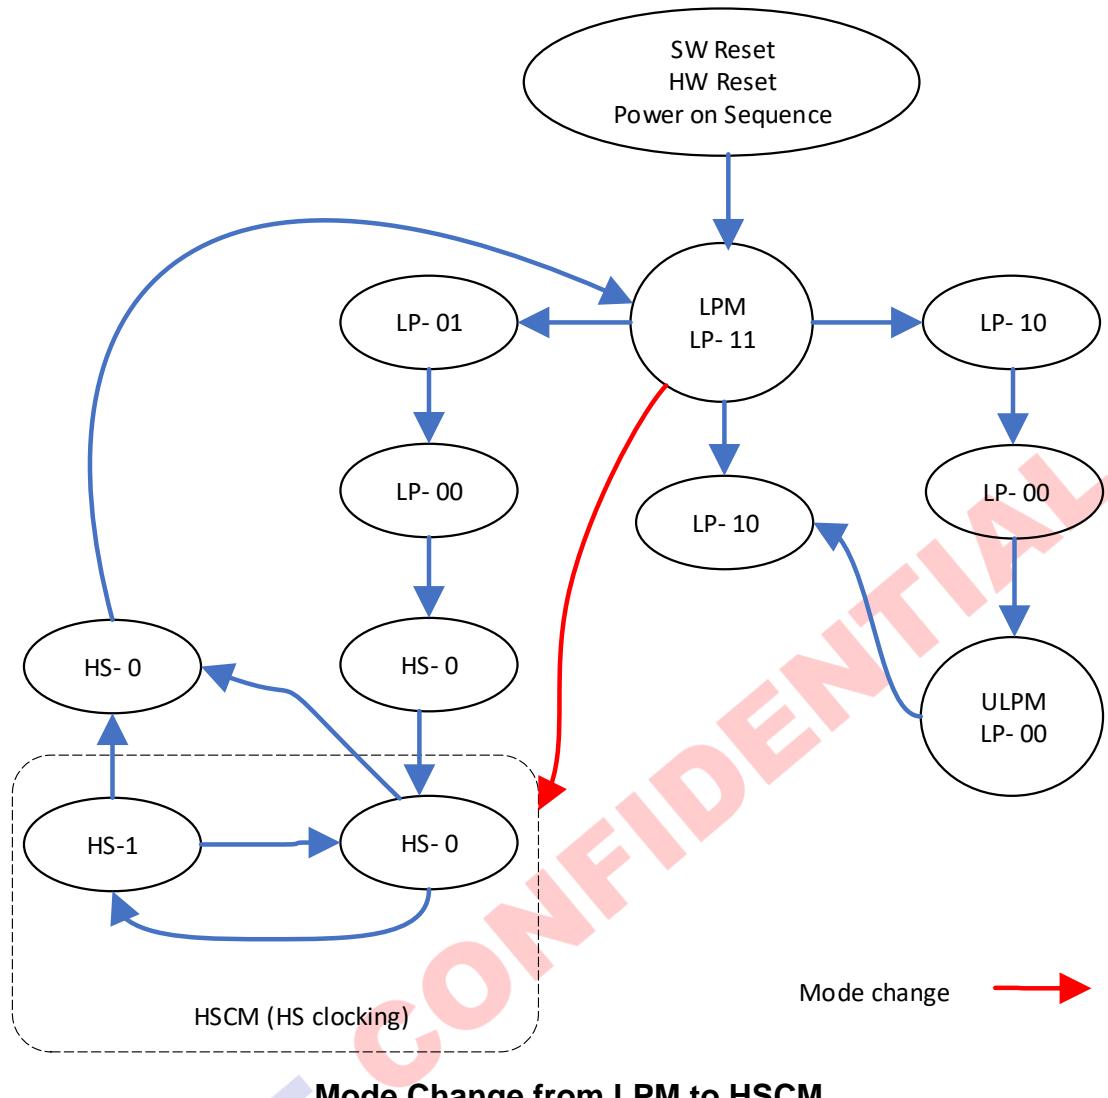

CLKP/N lanes can be driven to the High Speed Clock Mode (HSCM) when CLK lanes start to function between HS-0 and HS-1 State Codes. The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) => LP-01 => LP-00 => HS-0 => HS-0/1 (HSCM).

This sequence is illustrated below.

The mode change is also illustrated below.

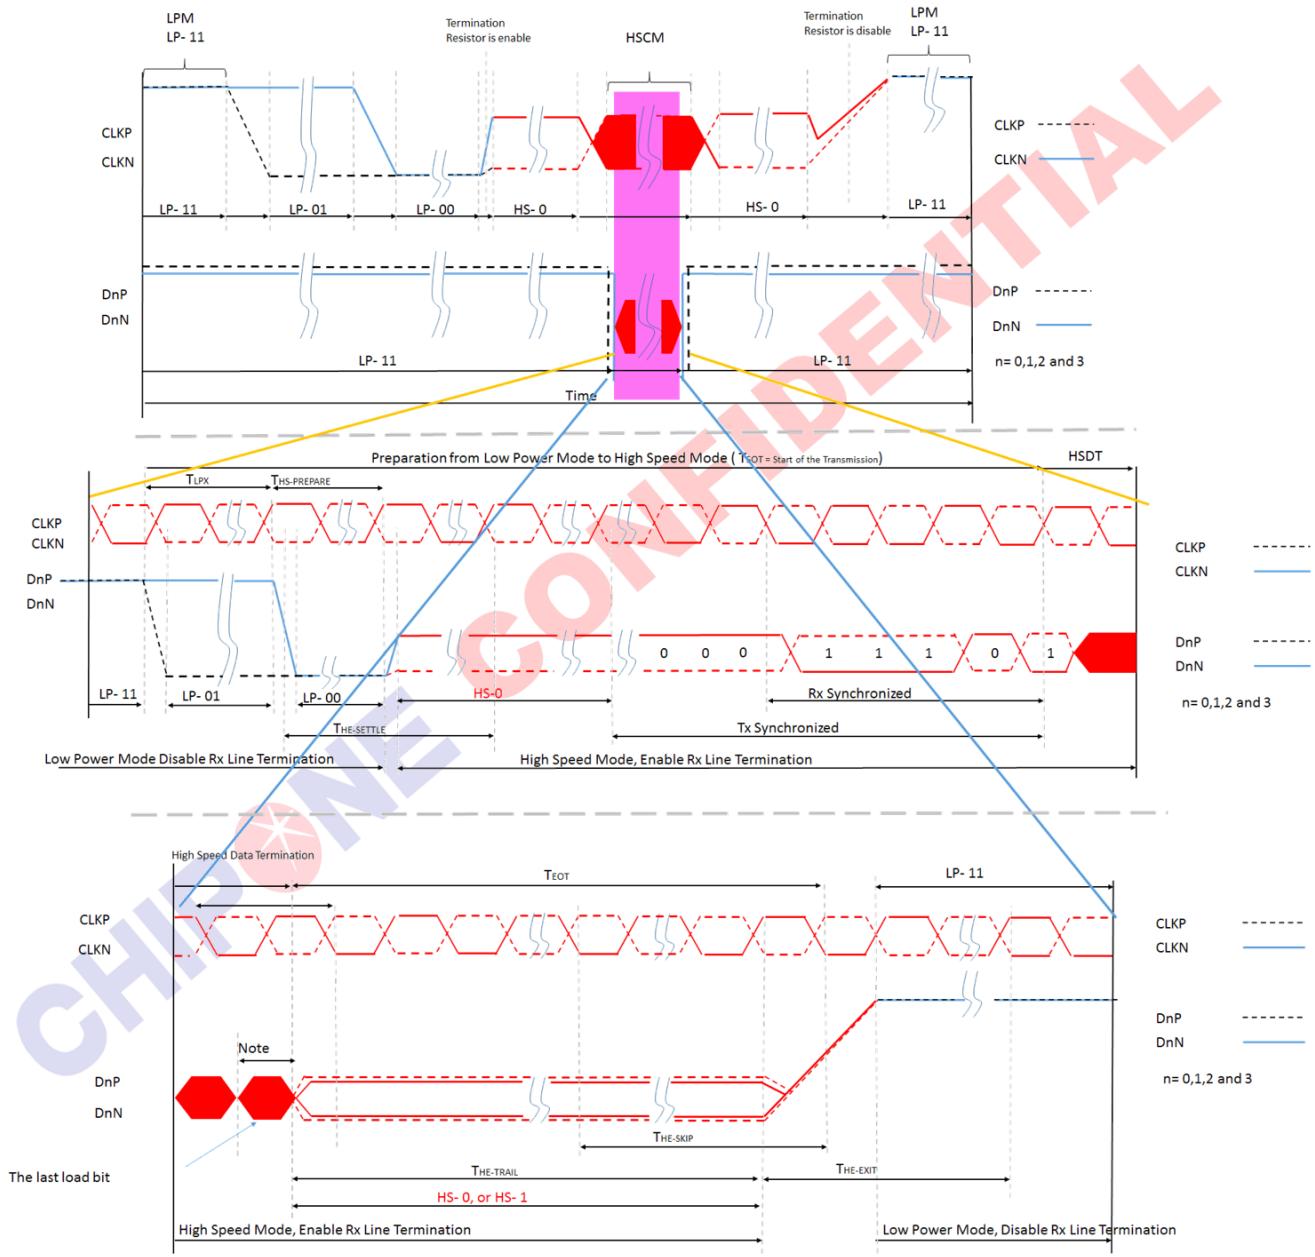

The high speed clock (CLKP/N) starts before high speed data is sent via data lanes. The high speed clock continues clocking after the high speed data sending is stopped.

The burst of the high speed clock consists of:

- Even number of transitions.
- Start state is HS- 0.
- End state is HS- 0.

High Speed Clock Burs

5.4.2 Interface Level Communication - DSI Data Lane

5.4.2.1 General

D0P/N, and D1P/N Data lanes can be driven into different modes:

- Escape Mode (Only D0P/N data lane is used).
- High- Speed Data Transmission (all data lanes are used).
- Bus Turnaround Request (Only D0P/N data lane are used).

These modes and their entering codes are defined in the following table.

Modes and entering code define

| Mode | Entering Mode Sequence | Leaving Mode Sequence |
|-------------------------------|--|----------------------------------|
| Escape Mode | LP- 11→ LP- 10→ LP- 00 → LP- 01 → LP- 00 | LP- 00→ LP- 10→ LP- 11 (Mark-1) |
| High- Speed Data Transmission | LP- 11→ LP- 01 → LP- 00 → HS- 0 | (HS- 0 or HS- 1)→ LP11 |
| Bus Turnaround Request | LP- 11→ LP- 10→ LP- 00 → LP- 10→ LP- 00 | Hi- Z |

CHIPONE

5.4.2.2 Escape Modes

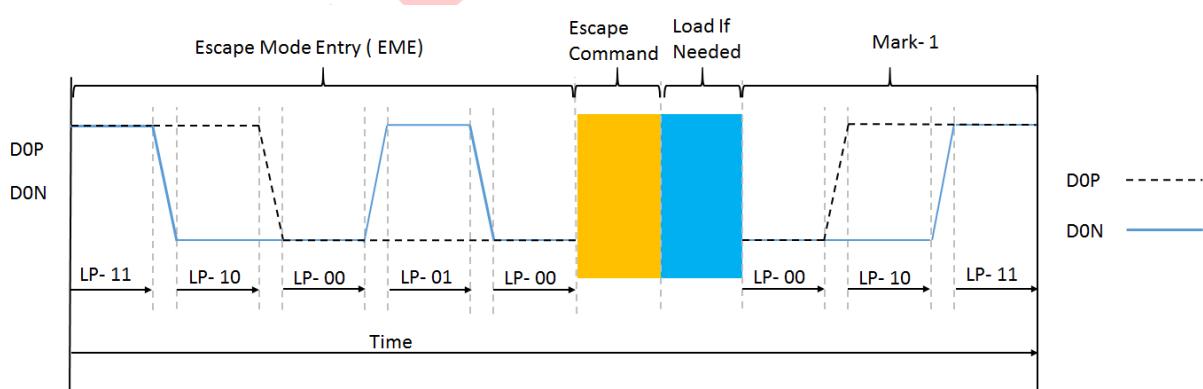

D0P/N data lanes can be used in different Escape Modes when data lanes are in the Low Power (LP) mode. These Escape Modes are used to:

- Send “Low-Power Data Transmission” (LPDT) from the MCU to the display module.
- Drive data lanes to “Ultra-Low Power State” (ULPS).
- Indicate “Remote Application Reset” (RAR), which can reset the display module.
- Indicate “Acknowledge” (ACK), which is used to transmit a non-error event from the display module to the MCU.

The basic sequence of the Escape Mode is as follows:

- Start: LP-11.
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00.
- Escape Command (EC), which is coded, when one of the data lanes changes from low-to-high-to-low then this changed data lane presents the value of the current data bit (D0P = 1, D0N= 0). When DSI-D0 changes from low-to-high-to-low, the receiver will latch a data bit, which value is logical 0. The receiver will use this low-to-high-to-low transition as its internal clock.
- A load if it is needed.
- Exit Escape (Mark-1) LP-00 => LP-10 => LP-11.
- End: LP-11.

This basic construction is illustrated below.

General Escape Mode Sequence

A total of eight Escape Commands (EC) are divided into two types: Mode and Trigger, as shown in below Table.

An example of the Mode type Escape Command is „Ultra-Low Power Mode”, where the MCU instructs the display module to enter its Ultra-Low Power Mode.

Escape commands are defined in the following table.

Escape commands define

| Escape Command | Command Type Mode / Trigger | Entry command Pattern (First Bit→ Last Bit Transmitted) | Dn | D0 |
|------------------------------|--------------------------------|--|----|----|
| Low- Power Data Transmission | Mode | 1110 0001 bin | | x |
| Ultra- Low Power Mode | Mode | 0001 1110 bin | x | x |
| Underfined- 1, Note1 | Mode | 1001 1111 bin | | |
| Underfined- 2, Note1 | Mode | 1101 1110 bin | | |
| Remote Application Reset | Trigger | 0110 0010 bin | | x |
| Acknowledge | Trigger | 0010 0001 bin | | x |
| UnKnow- 5, Note1 | Trigger | 1010 0000 bin | | |

Note 1: This Escape command support is not implemented on the display module.

Note 2: n=1.

Note 3: x= supported.

CHIPONE CONFIDENTIAL

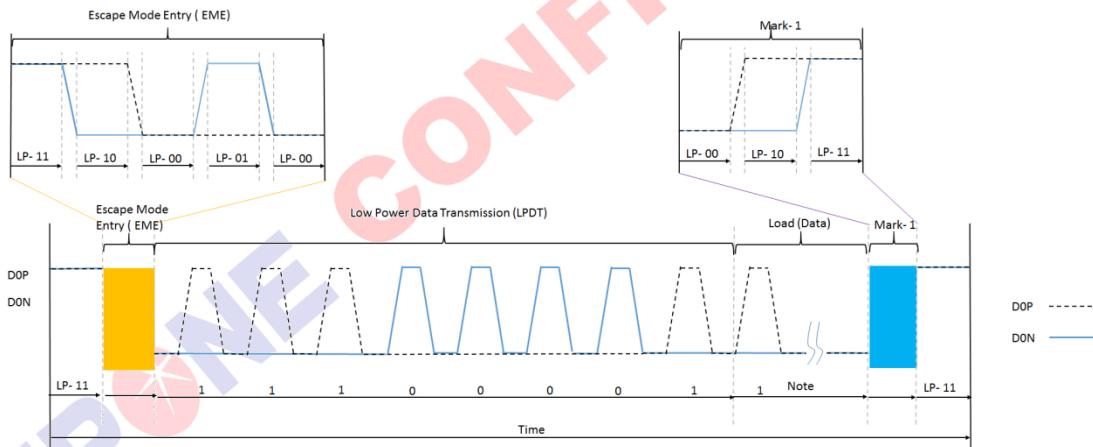

5.4.2.3 Low-Power Data Transmission (LPDT)

The MCU can send data to the display module in the Low-Power Data Transmission (LPDT) mode when data lanes enter the Escape Mode and Low-Power Data Transmission (LPDT) command is sent to the display module.

The display module also uses the same sequence when it sends data to the MCU. The Low Power Data Transmission (LPDT) uses the following sequence:

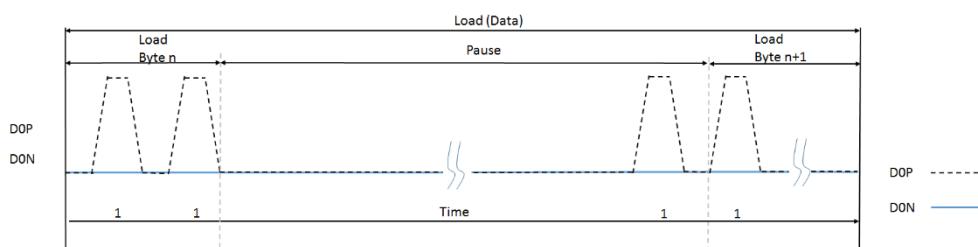

- Start: LP-11.
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00.
- Low-Power Data Transmission (LPDT) command in the Escape Mode: 1110 0001 (first to last bit).
- Load (Data).
- One or more bytes (one byte = 8 bit).
- Data lanes are in pause mode when data lanes are stopped (both lanes are low) between bytes.
- Mark-1: LP-00 => LP-10 => LP-11.
- End: LP-11.

This sequence is illustrated for reference purposes below.

Low-Power Data Transmission (LPDT)

Note: Load (Data) presents that the first bit is the logical 1 in this example.

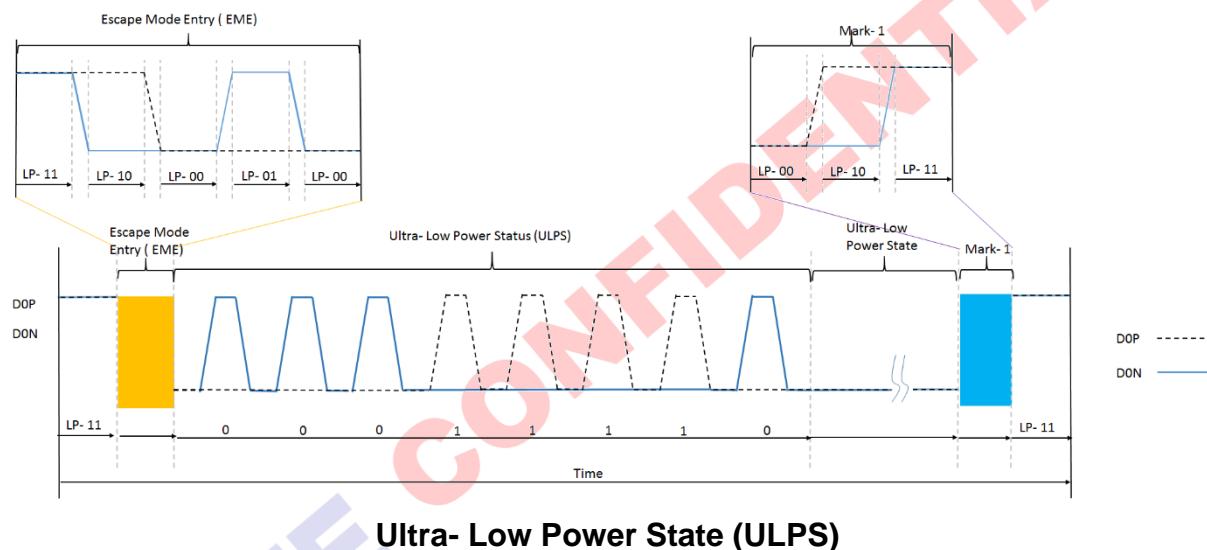

Pause (Example)

5.4.2.4 Ultra- Low Power State (ULPS)

The MCU can force data lanes get into the Ultra-Low Power State (ULPS) mode when data lanes enter the Escape Mode. The Ultra-Low Power State (ULPS) uses the following sequence:

- Start: LP-11.
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00.
- Ultra-Low Power State (ULPS) command in the Escape Mode: 0001 1110 (first to last bit).
- Ultra-Low Power State (ULPS) when the MCU keeps data lanes low.
- Mark-1: LP-00 => LP-10 => LP-11.
- End: LP-11 (Next command must wait 100us after data lanes leave ULPS).

This sequence is illustrated for reference purposes below.

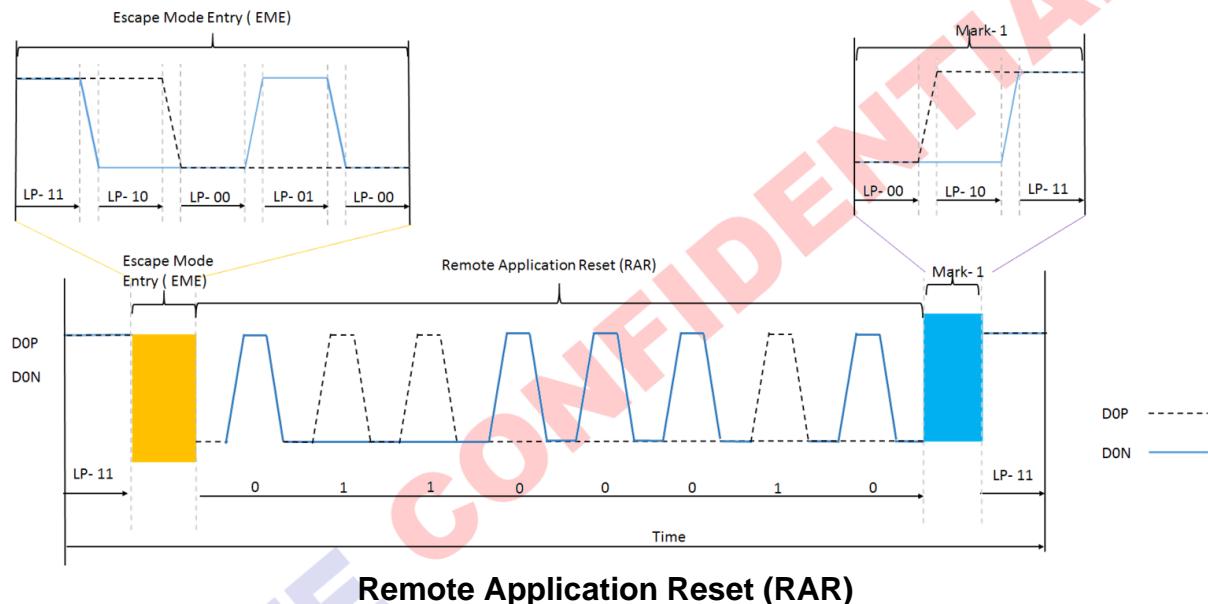

5.4.2.5 Remote Application Reset (RAR)

The MCU can inform the display module that it should be reset in Remote Application Reset (RAR) trigger when data lanes enter the Escape Mode. The Remote Application Reset (RAR) uses the following sequence:

- Start: LP-11.
 - Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00.
 - Remote Application Reset (RAR) command in Escape Mode: 0110 0010 (first to last bit).
 - Mark-1: LP-00 => LP-10 => LP-11.
 - End: LP-11.

This sequence is illustrated for reference purposes below.

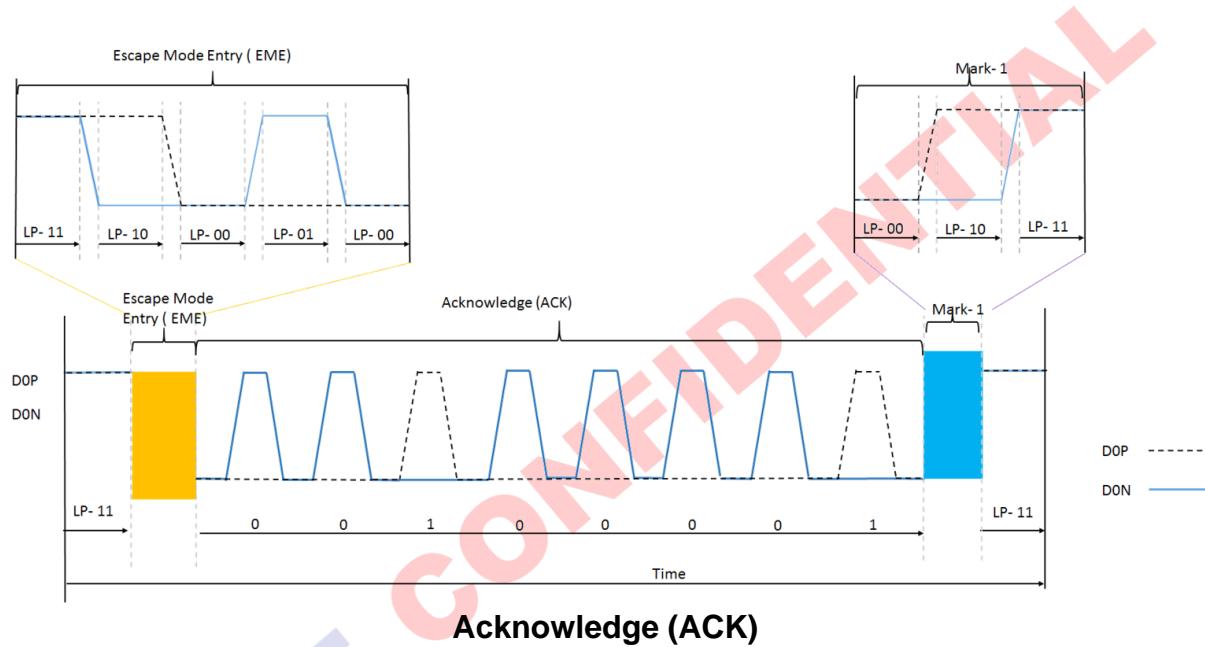

5.4.2.6 Acknowledge (ACK)

The display module can inform the MCU an error is not recognized by Acknowledge (ACK). The display module sends the Acknowledge (ACK) with the following sequence:

- Start: LP-11.
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00.
- Acknowledge (ACK) command in the Escape Mode: 0010 0001 (first to last bit).
- Mark-1: LP-00 => LP-10 => LP-11.
- End: LP-11.
-

This sequence is illustrated for reference purposes below.

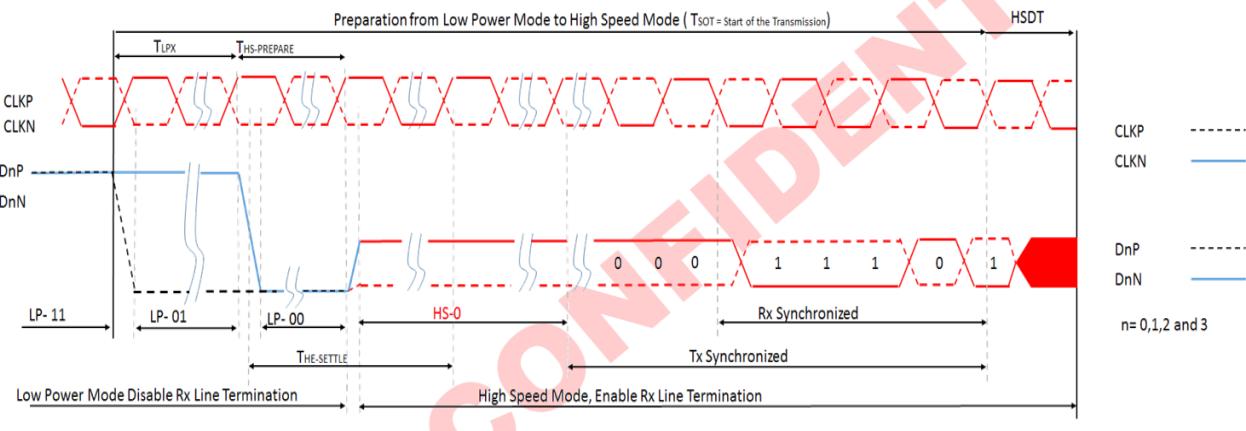

5.4.2.7 Entering High-Speed Data Transmission (TSOT of HSDT)

The display module enters High-Speed Data Transmission (HSDT) when Clock lane CLKP/N have already entered the High-Speed Clock Mode (HSCM) by the MCU. See more information in the section “High-Speed Clock Mode (HSCM)”. Data lanes D0P/N and D1P/N of the display module enter the High-Speed Data Transmission (TSOT of HSDT) as follows:

- Start: LP-11.
- HS-Request: LP-01.
- HS-Settle: LP-00 => HS-0 (Rx: Lane Termination Enable).
- Rx Synchronization: 011101 (Tx (= MCU) Synchronization: 0001 1101).
- End: High-Speed Data Transmission (HSDT) – Ready to receive High-Speed Data Load.

The sequence of entering High-Speed Data Transmission (TSOT of HSDT) is illustrated below.

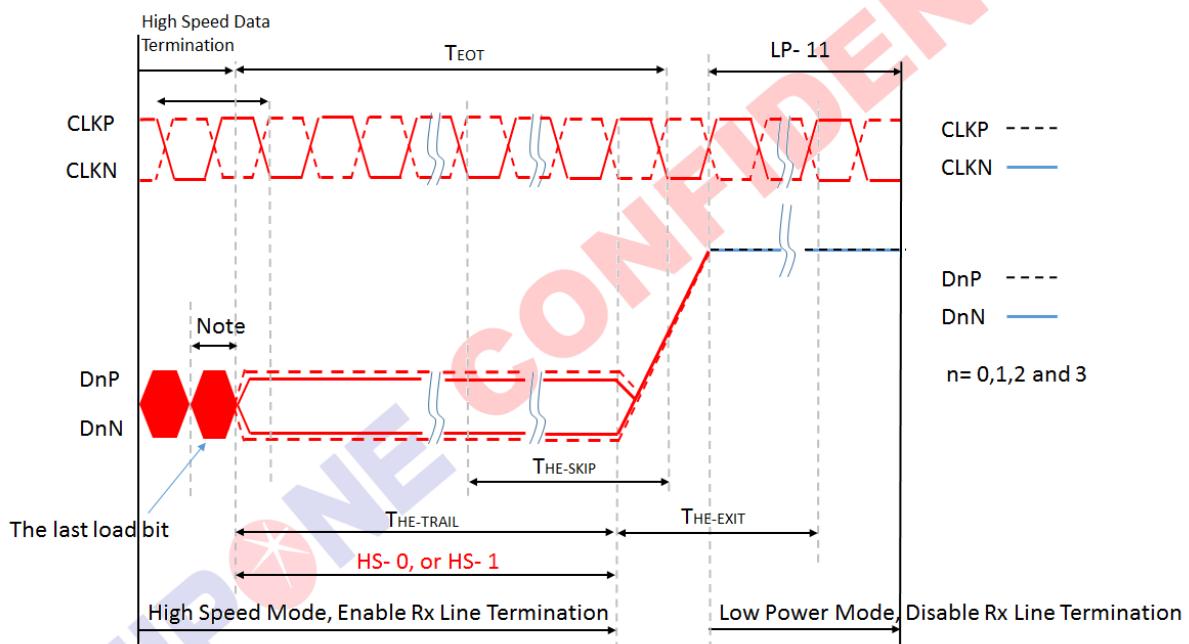

5.4.2.8 Leaving High-Speed Data Transmission (TEOT of HSDT)

The display module leaves the High-Speed Data Transmission (TEOT of HSDT) when Clock lane DSICLK/N are in the High-Speed Clock Mode (HSCM) by the MCU, and this HSCM is kept until data lanes D0P/N and D1P/N are in the LP-11 mode. See more information in the section “High-Speed Clock Mode (HSCM)”. Data lanes D0P/N and D1P/N of the display module leave the High-Speed Data Transmission (TEOT of HSDT) as follows:

- Start: High-Speed Data Transmission (HSDT).
- Stops High-Speed Data Transmission.
- MCU changes to HS-1, if the last load bit is HS-0.
- MCU changes to HS-0, if the last load bit is HS-1.
- End: LP-11 (Rx: Lane Termination Disable).

The sequence of leaving High-Speed Data Transmission (TEOT of HSDT) is illustrated below.

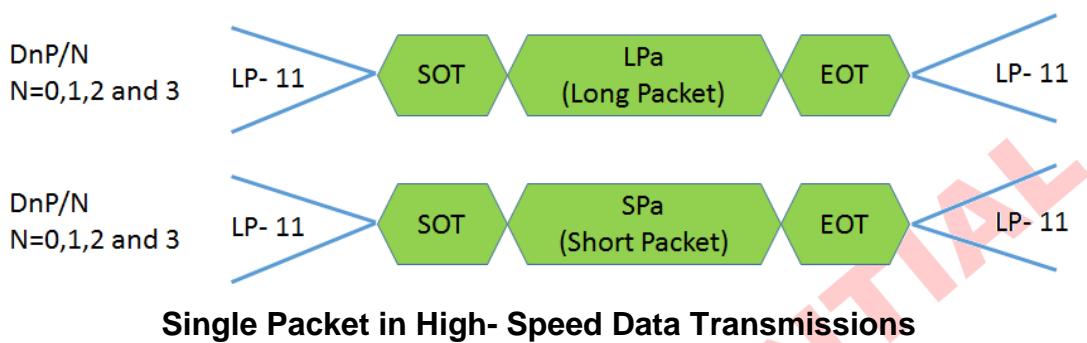

Note:

If the last load bit is HS- 0, the transmitter changes from HS- 0 to HS- 1.
If the last load bit is HS- 1, the transmitter changes from HS- 1 to HS- 0

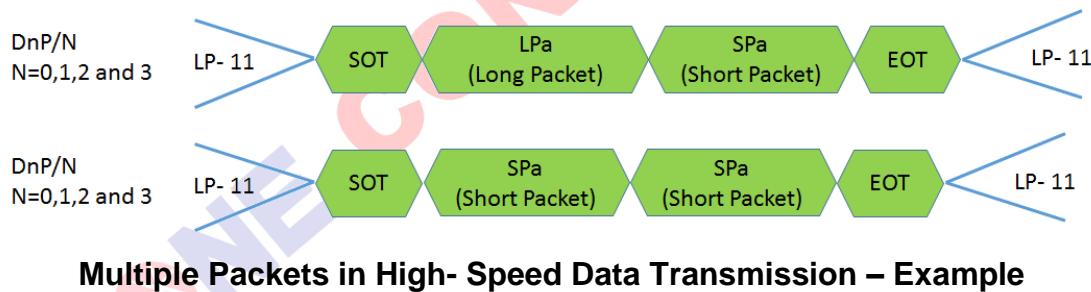

Leaving High-Speed Data Transmission (TEOT of HSDT)

5.4.2.9 Burst of the High- Speed Data Transmission (HSDT)

The burst of the “High-Speed Data Transmission” (HSDT) can consist of one or several data packet(s). These data packets can be Long (LPa) or Short (SPa) packets. These packets are defined in the section “Short Packet (SPa) and Long Packet (LPa) Structures”. These different burst of the High-Speed Data Transmission (HSDT) cases are illustrated for reference purposes below.

The multiple packets in High-Speed Data Transmission are illustrated for reference purposes below.

Explanations of Packet Abbreviation

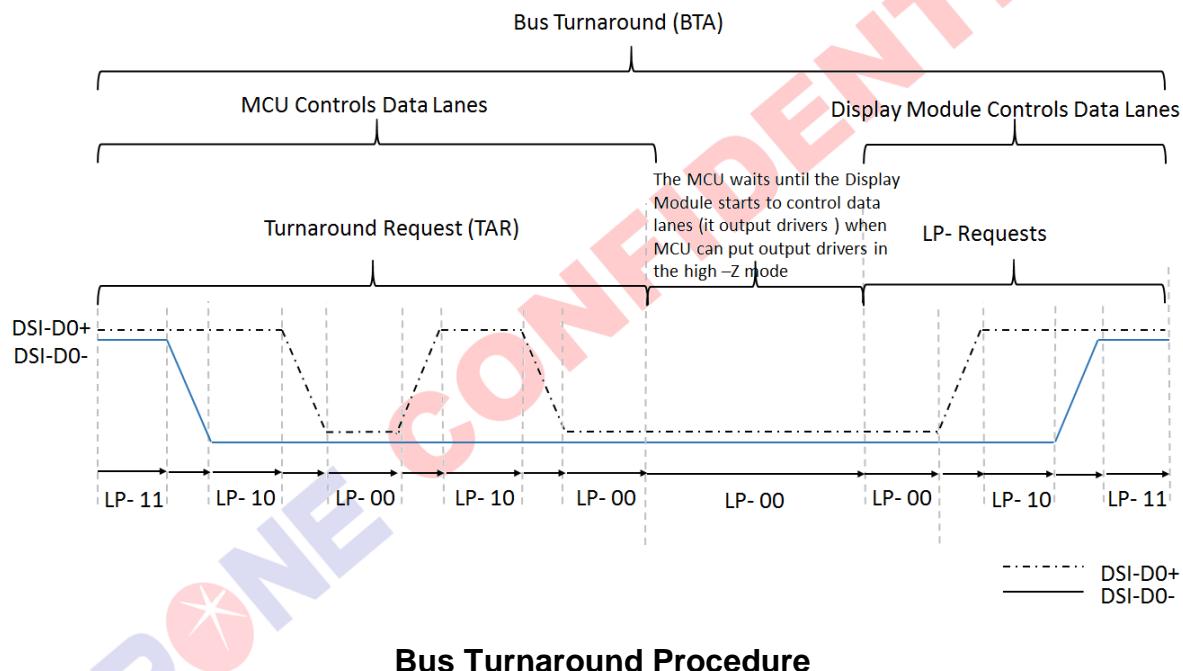

| Abbreviation | Explanation |
|--------------|--|
| EOT | End of the Transmission |
| LPa | Long Packet |
| LP-11 | Low Power Mode, Both of Data lanes stay at “1” (Stop Mode) |
| SPa | Short Packet |
| SOT | Start of the Transmission |

5.4.2.10 Bus Turnaround (BTA)

The MCU or display module, which controls D0P/N Data Lanes, can start a bus turnaround procedure when it requires information from a receiver, which can be the MCU or display module. The MCU and display module use the same sequence when this bus turnaround procedure is used. The sequence, when the MCU wants to do the bus turnaround procedure to the display module, is described for reference purposes as follows:

- Start (MCU): LP-11.
- Turnaround Request (MCU): LP-11 => LP-10 => LP-00 => LP-10 => LP-00.
- The MCU waits until the display module starts to control D0P/N data lanes and the MCU stops to control D0P/N data lanes (= High-Z).
- The display module changes to the stop mode: LP-00 => LP-10 => LP-11.

The bus turnaround procedure (from the MCU to the display module) is illustrated below.

Bus Turnaround Procedure

MCU and display module terms can be switched on above figure, if the Bus Turnaround (BTA) is from the display module to the MCU.

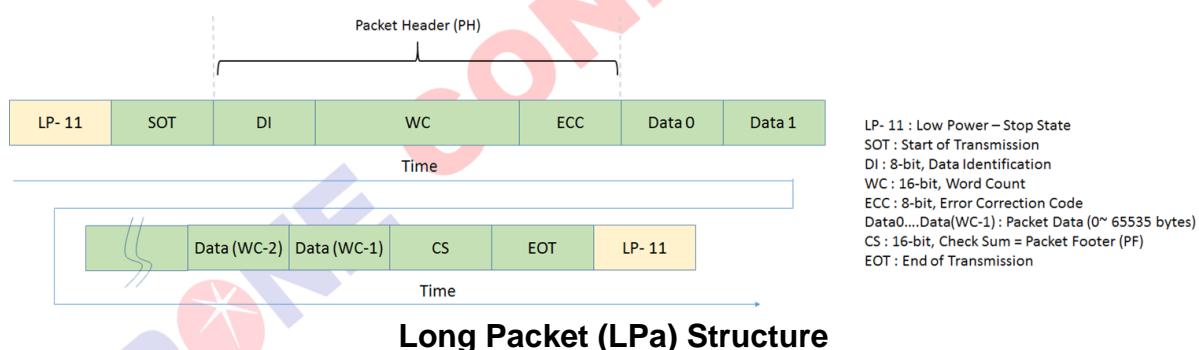

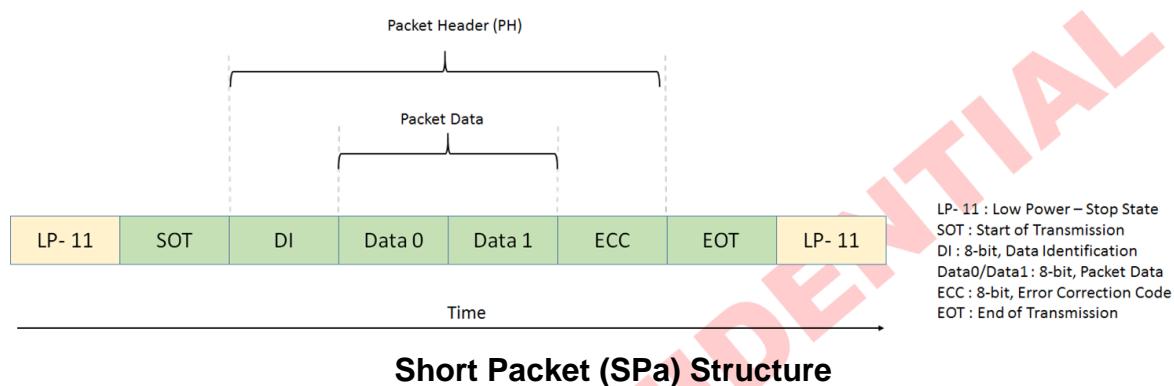

5.4.3 Packet Level Communication

5.4.3.1 Short Packet (SPa) and Long Packet (LPa) Structures

Short Packet (SPa) and Long Packet (LPa) are always used when data transmission is done in Low Power Data Transmission (LPDT) or High-Speed Data Transmission (HSDT) modes. The lengths of the packets are:

- Short Packet (SPa): 4 bytes.
- Long Packet (LPa): 6 to 65,541 bytes.

The type (SPa or LPa) of the packet can be recognized from their package headers (PH).

Notes 1. Short Packet (SPa) Structure and Long Packet (LPa) Structure present a single packet sending (= Includes LP-11, SOT and EOT for each packet sending).

Notes 2. The other possibility is that SOT, EOT and LP-11 are not needed between packets if packets are sent in multiple packet format, e.g:

- LP-11 → SOT → SPa → LPa → SPa → SPa → EOT → LP-11
- LP-11 → SOT → SPa → SPa → SPa → EOT → LP-11
- LP-11 → SOT → LPa → LPa → LPa → EOT → LP-11

5.4.3.2 Bit Order of the Byte on Packet

The bit order of the byte, what is used in packets, is that the Least Significant Bit (LSB) of the byte is sent first, and the Most Significant Bit (MSB) is sent last. The order is illustrated for reference purposes below.

| DI (Data Identification) | | | | | | | WC - LSB (Word Count – LSB) | | | | | | | WC – MSB (Word Count – MSB) | | | | | | | ECC (Error Correction Code) | | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|---|---|
| 8'b 29H | | | | | | | 8'b 01H | | | | | | | 8'b 00H | | | | | | | 8'b 06H | | | | | | | | | |
| 1 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | |
| B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | |

Bit order of the byte on packet

5.4.3.3 Byte Order of the Multiple Byte Information on Packets

Byte order of the multiple bytes information, what is used in packets, is that the Least Significant (LS) Byte of the information is sent first and the Most Significant (MS) Byte is sent last. For example, Word Count (WC) consists of 2 bytes (= 16 bits); while the LS byte is sent first and the MS byte is sent last. The order is illustrated for reference purposes below.

| WC - LSB (Word Count – LSB) | | | | | | | | WC – MSB (Word Count – MSB) | | | | | | | |
|--------------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|
| 8'b 01H | | | | | | | | 8'b 00H | | | | | | | |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| B | B | B | B | B | B | B | B | B | B | B | B | B | B | B | B |

Time →

Order of the multiple byte information on packets

5.4.3.4 Packet Header (PH)

The packet header always consists of 4 bytes. The content of these 4 bytes are different for Short Packet (SPa) and Long Packet (LPa).

- Short Packet (SPa) :

- 1st byte: Data Identification (DI) => Identify that this is a Short Packet (SPa).
- 2nd and 3rd bytes: Packet Data (PD), Data 0 and 1.
- 4th byte: Error Correction Code (ECC).

| DI (Data Identification) | | | | | | | | Data 0 (Packet Data) | | | | | | | | Data 1 (Packet Data) | | | | | | | | ECC (Error Correction Code) | | | | | | | |
|--|---|---|---|---|---|---|---|-------------------------|---|---|---|---|---|---|---|-------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|
| 8'b 15H | | | | | | | | 8'b 3AH | | | | | | | | 8'b 07H | | | | | | | | 8'b 18H | | | | | | | |
| 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

| Packet Header (PH) in a Long Packet (LPa) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

5.4.3.5 Data Identification (DI)

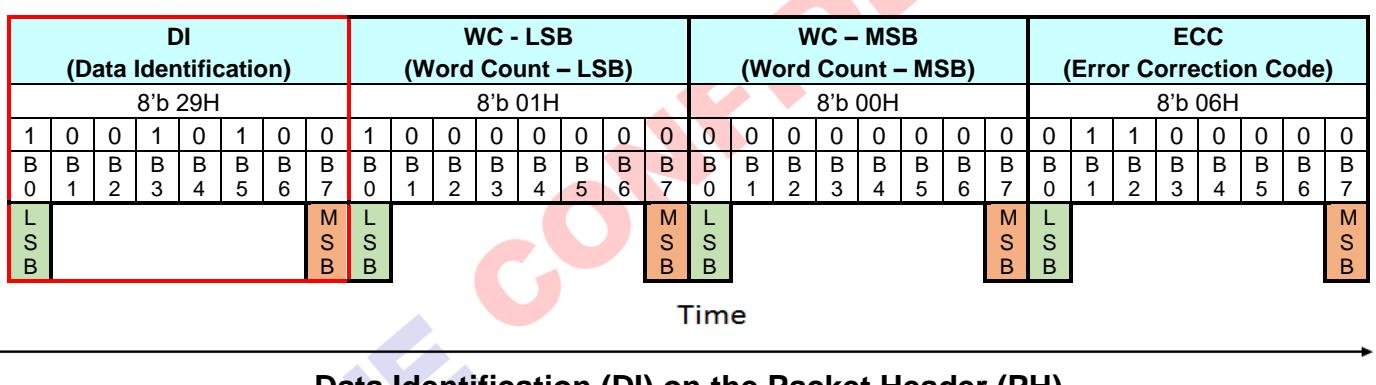

Data Identification (DI) is a part of the Packet Header (PH), and it consists of 2 parts:

- Virtual Channel (VC), 2 bits, DI [7...6].
- Data Type (DT), 6 bits, DI [5...0].

The Data Identification (DI) structure is illustrated, see the figure below.

Data Identification (DI) in the Packet Header (PH) is illustrated for reference purposes below.

5.4.3.6 Virtual Channel (VC)

Virtual Channel (VC) is a part of Data Identification (DI [7:6]) structure, and it is used to address where a packet is to be sent from the MCU. Bits of the Virtual Channel (VC) are illustrated for reference purposes below.

| DI (Data Identification) | | | | | | | | WC - LSB (Word Count – LSB) | | | | | | | | WC – MSB (Word Count – MSB) | | | | | | | | ECC (Error Correction Code) | | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|---|---|
| 8'b 29H | | | | | | | | 8'b 01H | | | | | | | | 8'b 00H | | | | | | | | 8'b 06H | | | | | | | | | |
| 1 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

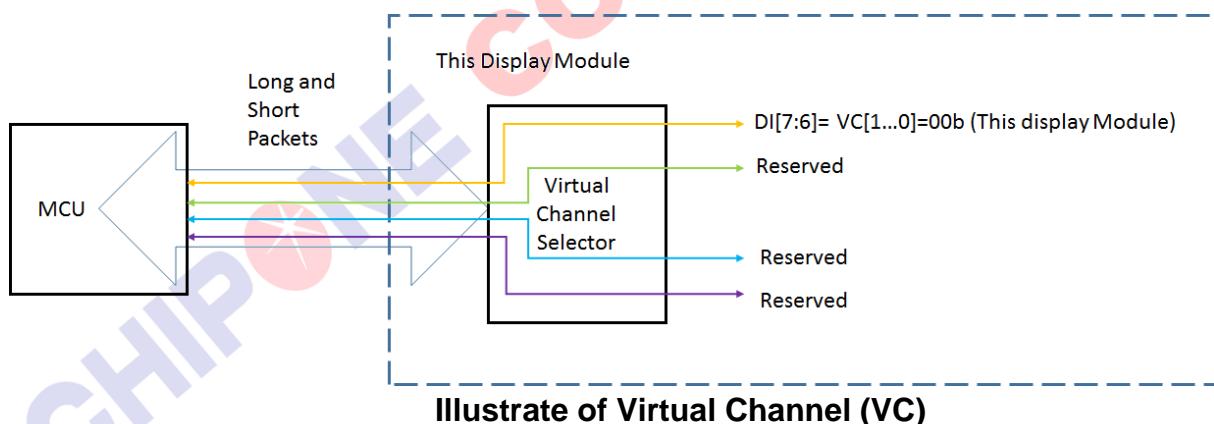

Time →

Virtual Channel (VC) on the Packet Header (PH)

Virtual Channel (VC) can assign 4 different channels for 4 different display modules. Devices will use the same virtual channel as which the MCU uses to send packets to them, e.g.

- The MCU uses the virtual channel 0 when it sends packets to the CO5300.
- The CO5300 also uses the virtual channel 0 when it sends packets to the MCU.

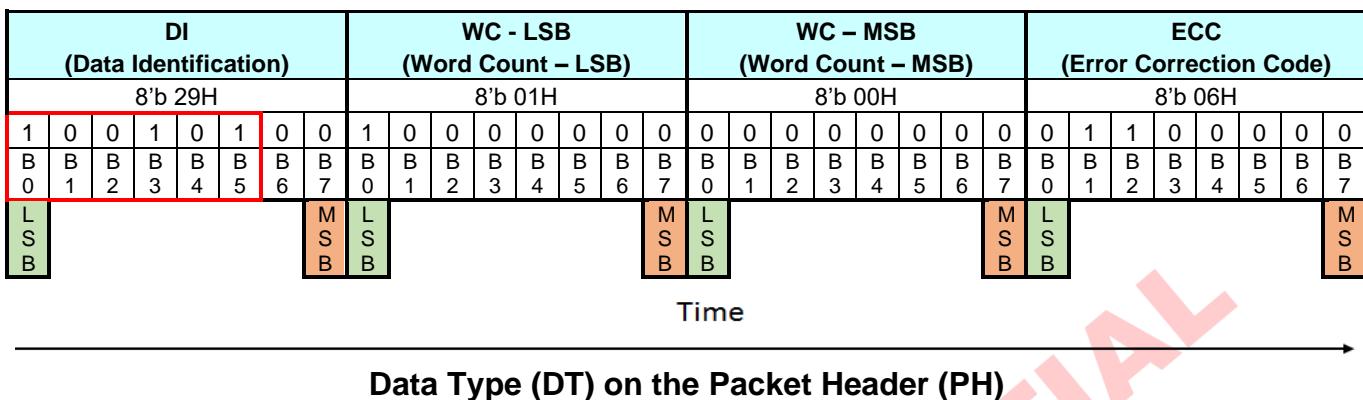

This functionality is illustrated below.

Virtual Channel (VC) is always 0 (DI [7:6] = VC [1:0] = 00b) when the MCU sends “End of Transmission Packet” to the display module. See the section “End of Transmission Packet (EoTP)”. This display module does not support the virtual channel selector for other devices (1 to 3) when the only possible virtual channel (VC [1:0]) is 00b for the CO5300.

5.4.3.7 Data Type (DT)

Data Type (DT) is a part of Data Identification (DI [5...0]) structure, and it is used to define the type of the used data in a packet. Bits of the Data Type (DT) are illustrated for reference purposes below.

This Data Type (DT) also defines the used packet is a Short Packet (SPa) or a Long Packet (LPa). Data Types (DT) are different from the MCU to the display module (or other devices) and vice versa. These Data Types (DT) are defined in the tables below.

Data Types (DT) define List

| From the MCU to the Display Module | | |
|------------------------------------|---|---------------------|
| Hex | Description | Short / Long Packet |
| 01 | Sync Even, V Sync Start | SPa (Short Packet) |
| 11 | Sync Even, V Sync End | SPa (Short Packet) |
| 21 | Sync Even, H Sync Start | SPa (Short Packet) |
| 31 | Sync Even, H Sync End | SPa (Short Packet) |
| 08 | End of Transmission Packet (EOTP) Note1 | SPa (Short Packet) |
| 02 | Color Mode Off Command | SPa (Short Packet) |
| 12 | Color Mode On Command | SPa (Short Packet) |
| 22 | Shut Down Peripheral Command | SPa (Short Packet) |
| 32 | Turn On Peripheral Command | SPa (Short Packet) |
| 03 | Generic Short WRITE, no parameters | SPa (Short Packet) |
| 13 | Generic Short WRITE, 1 parameters | SPa (Short Packet) |
| 23 | Generic Short WRITE, 2 parameters | SPa (Short Packet) |
| 04 | Generic Short READ, no parameters | SPa (Short Packet) |
| 14 | Generic Short READ, 1 parameters | SPa (Short Packet) |
| 24 | Generic Short READ, 2 parameters | SPa (Short Packet) |
| 05 | DCS Write, No Parameter | SPa (Short Packet) |
| 15 | DCS Write, 1 Parameter | SPa (Short Packet) |
| 06 | DCS Read, No Parameter | SPa (Short Packet) |
| 37 | Set Maximum Return Packet Size | SPa (Short Packet) |

| From the MCU to the Display Module | | |
|------------------------------------|---|-------------------|
| 09 | Null Packet, No Data, Note2 | LPa (Long Packet) |
| 19 | Blanking Packet, no data | LPa (Long Packet) |
| 29 | Generic Long Write | LPa (Long Packet) |
| 39 | DCS Write Long | LPa (Long Packet) |
| 1E | Packed Pixel Stream, 18-bit RGB, 6-6-6 Format | LPa (Long Packet) |
| 2E | Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format | LPa (Long Packet) |
| 3E | Packed Pixel Stream, 24-bit RGB, 8-8-8 Format | LPa (Long Packet) |
| X0 | DO NOT USE | |
| XF | All unspecified codes are reserved | |

Note 1: This can be used when the MCU wants to make sure that it is the end of the transmission in High Speed Data Transferring (HSDT) mode.

Note 2. This can be used when data lanes are to be kept in High Speed Data Transferring (HSDT) Mode.

Data Type (DT) from the Display Module (or Other Devices) to the MCU.

Data Type (DT) from the Display Module (or Other Devices) to the MCU

| From the Display Module to the MCU | | |
|------------------------------------|--|---------------------|
| Hex | Description | Short / Long Packet |
| 02h | Acknowledge with Error Report | SPa (Short Packet) |
| 1Ch | DCS Read Long Response | LPa (Long Packet) |
| 21h | DCS Read Short Response, 1 byte returned | SPa (Short Packet) |
| 22h | DCS Read Short Response, 2 byte returned | SPa (Short Packet) |
| 1Ah | Generic Read Long Response | LPa (Long Packet) |
| 11h | Generic Read Short Response, 1 byte returned | SPa (Short Packet) |
| 12h | Generic Read Short Response, 2 byte returned | SPa (Short Packet) |

Note: The data type for Generic write/read: 1Ah, 11h, 12 will be disable (ignored packet) if bit DSIG is set to "0".

The receiver will ignore other Data Type (DT) if they are not defined on tables: "Data Type (DT) from the MCU to the Display Module (or Other Devices)" or "Data Type (DT) from the Display Module (or Other Devices) to the MCU".

5.4.3.8 Packet Data (PD) in a Short Packet (SPa)

Packet Data (PD) of the Short Packet (SPa) is placed after Data Type (DT) of the Data Identification (DI) and indicates a Short Packet (SPa) is to be sent. Packet Data (PD) of a Short Packet (SPa) consists of 2 data bytes: Data 0 and Data 1. The sending order of the Packet Data (PD) is that Data 0 is sent first and the Data 1 is sent last. Bits of Data 1 are set to 0 if the information length is 1 byte. Packet Data (PD) of a Short Packet (SPa), when the length of the information is 1 or 2 bytes and Virtual Channel (VC) is 0, are illustrated for reference purposes below.

- Packet Data (PD) information:
 - Data 0: 26Hex (Display Command Set (DCS) with 1 Parameter => DI (Data Type (DT)) = 15Hex).
 - Data 1: 01Hex (DCS's Parameter).

| DI (Data Identification) | | | | | | | | Data 0 (Packet Data) | | | | | | | | Data 1 (Packet Data) | | | | | | | | ECC (Error Correction Code) | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|-------------------------|---|---|---|---|---|---|---|-------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|

Packet Data (PD) for Short Packet (SPa), 1 Byte Information

5.4.3.9 Word Count (WC) in a Long Packet (LPa)

Word Count (WC) of the Long Packet (LPa) is placed after Data Type (DT) of the Data Identification (DI) and indicates that a Long Packet (LPa) is to be sent. Word Count (WC) indicates the amount of data bytes of the Packet Data (PD) that is to be sent after the Packet Header (PH). The location of the Word Count (WC) in a Long Packet is the same as which of the Packet Data (PD) in a Short Packet (SPa), as shown in Figure 5.4.9-2. Word Count (WC) of the Long Packet (LPa) consists of 2 bytes. The sending order of these 2 bytes of the Word Count (WC) is that the Least Significant (LS) Byte is sent first, and the Most Significant (MS) Byte is sent last. Word Count (WC) of a Long Packet (LPa) is illustrated for reference purposes below.

Packet Data in Short and Long Packets

5.4.3.10 Error Correction Code (ECC)

The Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors. The ECC protects the following fields:

- Short Packet (SPa): Data Identification (DI) byte (8 bits: D [0...7]), Packet Data (PD) bytes (16 bits: D [8...23]) and ECC (8 bits: P [0...7]).
- Long Packet (LPa): Data Identification (DI) byte (8 bits: D [0...7]), Word Count (WC) bytes (16 bits: D [8...23]) and ECC (8 bits: P [0...7]) D [23...0] and P [7...0] are illustrated for reference purposes below.

| DI (Data Identification) | | | | | | | | Data 0 (Packet Data) | | | | | | | | Data 1 (Packet Data) | | | | | | | | ECC (Error Correction Code) | | | | | | | |

D [23:0] and D 7:0] in a Long Packet (LPa)

Error Correction Code (ECC) can recognize one or several error(s) and can only correct one-bit error. Bits (P [7...0]) of the Error Correction Code (ECC) are defined, where the symbol „^“ presents the XOR function (Pn is 1 if there is odd number of 1, and Pn is 0 if there is even number of 1) as follows.

- P7 = 0.
- P6 = 0.
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23.
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23.
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23.
- P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22.
- P1 = D0^D1^D3^D4^D6^D8^D10^D12^D14^D17^D20^D21^D22^D23.
- P0 = D0^D1^D2^D4^D5^D7^D10^D11^D13^D16^D20^D21^D22^D23.

P7 and P6 are set to 0 because Error Correction Code (ECC) is based on 64 bit value (D

[63...0]), but this implementation is based on 24 bit value (D [23...0]). Therefore, only 6 bits are needed (P [5...0]) for Error Correction Code (ECC).

| DI (Data Identification) | | | | | | | | Data 0 | | | | | | | | Data 1 | | | | | | | | ECC (Error Correction Code) | | | | | | | | | |

XOR Function on Long Packet (LPa)

The transmitter (= the MCU or the Display Module) will send data bits D [23...0] and Error Correction Code (ECC) P [7...0]. The receiver (= the Display module or the MCU) will calculate the Internal Error Correction Code (IECC) and compare the received Error Correction Code (ECC) and the Internal Error Correction Code (IECC). This comparison is done when each power bit of ECC and IECC have performed the XOR function. The result of this function is PO [7...0]. This functionality, where the transmitter is the MCU and the receiver is the display module, is illustrated for reference purposes below.

Internal Error Correction Code (IECC) on the Display Module (= the Receiver)

The sent data bits (D [23...0]) and ECC (P [7...0]) are correctly received if the value of the PO [7...0] is 00h.

The sent data bits (D [23...0]) and ECC (P [7...0]) are not correctly received if the value of the PO [7...0] is not 00h.

| | | |
|----------------------------|-----------------|-------------------|
| ECC P [7:0] | 1 1 0 0 0 0 0 0 | 03h |
| IECC PI [7:0] | 1 1 0 0 0 0 0 0 | 03h |
| XOR (ECC, IECC) => PO[7:0] | 0 0 0 0 0 0 0 0 | = 00h => No Error |
| | L | M |
| | S | S |
| | B | B |

Internal XOR Calculation between ECC and IECC Values – No Error

| | | |
|----------------------------|-----------------|----------------|
| ECC P [7:0] | 1 1 0 0 0 0 0 0 | 03h |
| IECC PI [7:0] | 1 1 1 1 0 0 0 0 | 0Fh |
| XOR (ECC, IECC) => PO[7:0] | 0 0 1 1 0 0 0 0 | = 0Ch => Error |
| | L S B | M S B |

Internal XOR Calculation between ECC and IECC Values – Error

The received Error Correction Code (ECC) can be 00h when the Error Correction Code (ECC) function is not used for data values D [23...0] on the transmitter side. The number of the errors (one or more) can be defined when the value of the PO [7...0] is compared to the values in the following table.

The number of the errors define

| Data Bit | PO7 | PO6 | PO5 | PO4 | PO3 | PO2 | PO1 | PO0 | Hex |
|----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| D [0] | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 07h |
| D [1] | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0Bh |
| D [2] | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0Dh |
| D [3] | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0Eh |
| D [4] | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 13h |
| D [5] | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 15h |
| D [6] | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 16h |
| D [7] | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 19h |
| D [8] | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1Ah |
| D [9] | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1Ch |
| D [10] | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 23h |
| D [11] | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 25h |
| D [12] | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 26h |
| D [13] | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 29h |
| D [14] | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 2Ah |
| D [15] | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 2Ch |
| D [16] | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 31h |
| D [17] | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 32h |
| D [18] | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 34h |
| D [19] | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 38h |
| D [20] | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1Fh |
| D [21] | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 2Fh |
| D [22] | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 | 37h |
| D [23] | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 3Bh |

An error is detected if the value of the PO [7...0] is in Table, and the receiver can correct this one bit error because this found value also defines the location of the corrupt bit, e.g.

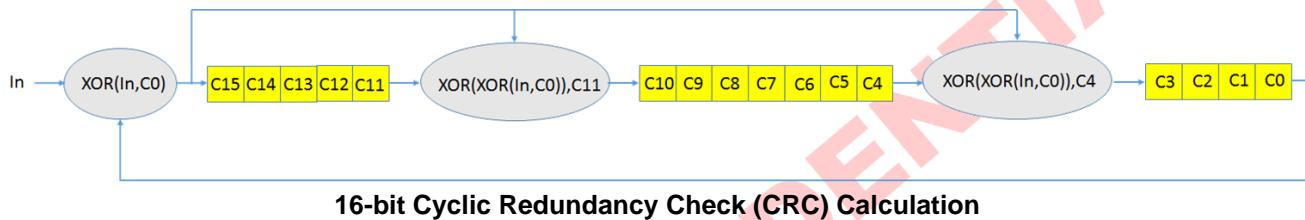

- PO [7...0] = 0Eh.
- The bit of the data (D [23...0]), that is not correct, is D [3] More than one error is detected if the value of the PO [7...0] is not in Table for example, PO [7...0] = 0Ch.

5.4.3.11 Packet Data (PD) in a Long Packet (LPa)

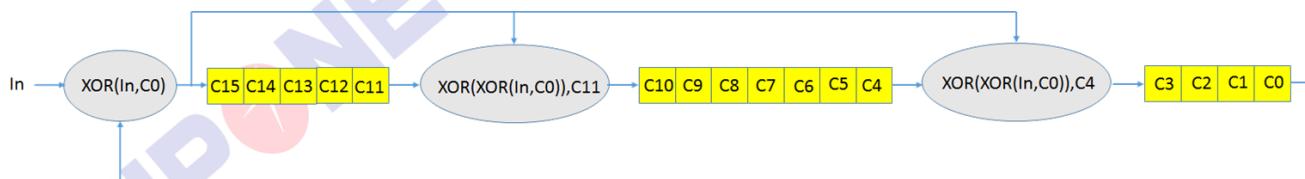

Packet Data (PD) of a Long Packet (LPa) is placed after the Packet Header (PH) of a Long Packet (LPa). The amount of the data bytes is defined in the section “Word Count (WC) in a Long Packet (LPa)”.

5.4.3.12 Packet Footer (PF) in a Long Packet (LPa)

Packet Footer (PF) of a Long Packet (LPa) is placed after the Packet Data (PD) of a Long Packet (LPa). The Packet Footer (PF) is a checksum value that is calculated from the Packet Data of the Long Packet (LPa). The checksum uses a 16-bit Cyclic Redundancy Check (CRC) value which is generated by a polynomial $X^{16}+X^{12}+X^5+X^0$, as illustrated below.

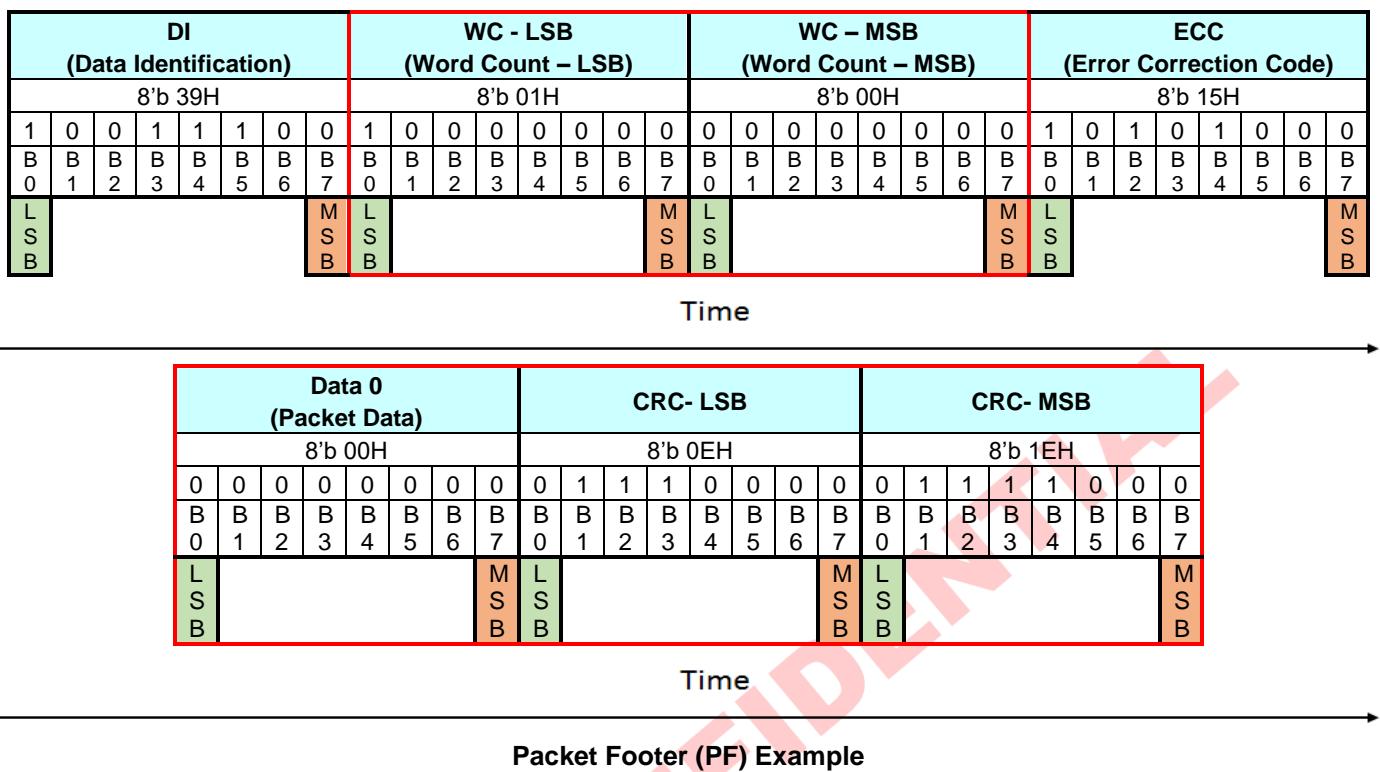

The 16-bit Cyclic Redundancy Check (CRC) generator is initialized to FFFFh before calculations. The Most Significant Bit (MSB) of the data byte of the Packet Data (PD) is the first bit which is inputted into the 16-bit Cyclic Redundancy Check (CRC). An example of the 16-bit Cyclic Redundancy Check (CRC), where the Packet Data (PD) of a Long Packet (LPa) is 01h, is illustrated (step-by-step) below.

| Step | In | XOR(in,C0) | C15 | C14 | C13 | C12 | C11 | XOR(XOR(in,C0),C11,(Step-1)) | C10 | C9 | C8 | C7 | C6 | C5 | C4 | XOR(XOR(in,C0),C4,(Step-1)) | C3 | C2 | C1 | C0 | MSB | |
|------|--------|------------|-----|-----|-----|-----|-----|------------------------------|-----|----|----|----|----|----|----|-----------------------------|----|----|----|----|-----|--|
| 0 | X | X | 1 | 1 | 1 | 1 | 1 | X | 1 | 1 | 1 | 1 | 1 | 1 | 1 | X | 1 | 1 | 1 | 1 | X | |
| 1 | 1(LSB) | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | |
| 2 | 0 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | |
| 3 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | |
| 4 | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | |
| 5 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | |
| 6 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | |
| 7 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | |
| 8 | 0(MSB) | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | |
| | 1byte | CRC result | 0 | 0 | 0 | 1 | 1 | | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | | 1 | 1 | 1 | 0 | |

CRC Calculation – Packet Data (PD) is 01h

The value of the Packet Footer (PF) is 1E0Eh in this example (Command 01h has been sent), and is illustrated below.

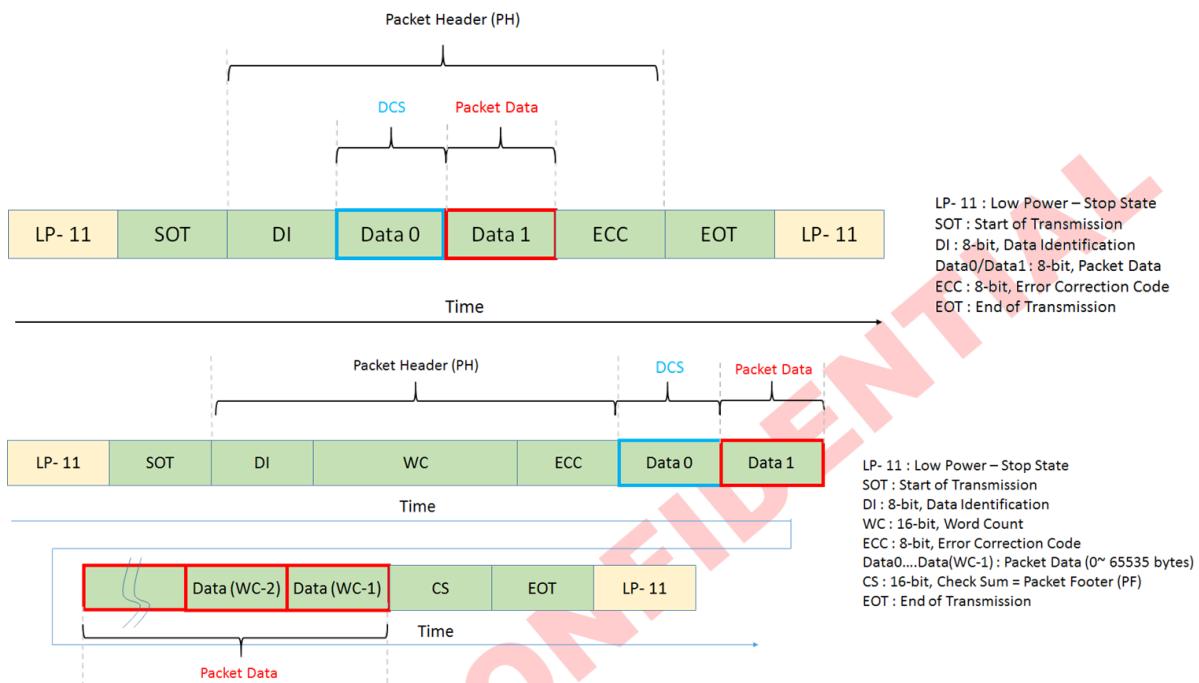

The receiver calculates its checksum value from the received Packet Data (PD). The receiver compares its checksum and the Packet Footer (PF) that the transmitter has sent. The received Packet Data (PD) and Packet Footer (PF) are correct if the checksum of the receiver and Packet Footer (PF) are equal. The received Packet Data (PD) and Packet Footer (PF) are not correct if the checksum of the receiver and Packet Footer (PF) are not equal.

5.4.4 Packet Transmissions

5.4.4.1 Display Command Set (DCS)

Display Command Set (DCS), defined in the section “Command 1 Description”, is used from the MCU to the display module. This Display Command Set (DCS) is always defined in the Data 0 of the Packet Data (PD), and is included in Short Packet (SPa) and Long packet (LPa), as illustrated below.

Display Command Set (DCS) in Short Packet (SPa) and Long Packet (LPa)

CHIPONE

5.4.4.2 Display Command Set (DCS) Write, No Parameter (DSCWN-S)

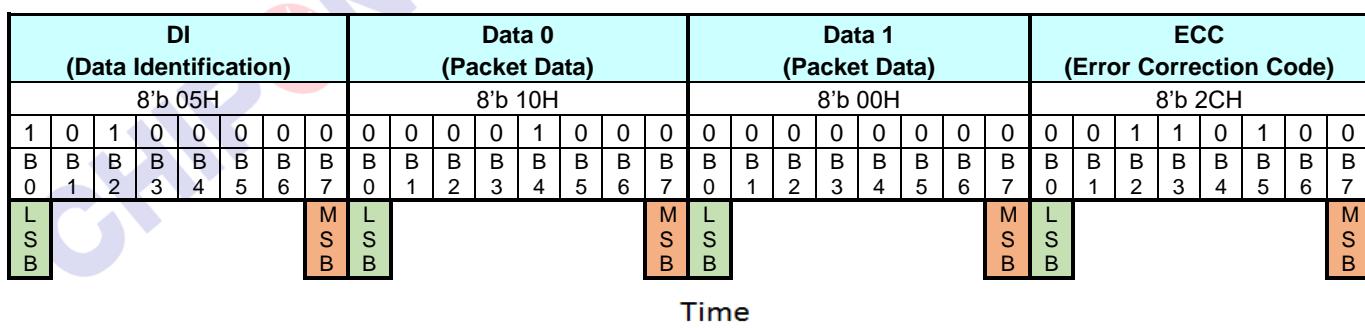

“Display Command Set (DCS) Write, No Parameter”, which is defined in Data Type (DT, 00 0101b), is always used in a Short Packet (SPa) from the MCU to the display module. These commands are defined in a table below:

DSCWN-S Commands

| Command |
|-------------------------------|
| NOP (00h) |
| Software Reset (01h) |
| Sleep In (10h) |
| Sleep Out (11h) |
| Normal Display Mode On (13h) |
| INVOff (20h) |
| INVOn (21h) |
| All Pixel Off (22h) |
| All Pixel On (23h) |
| Display Off (28h) |
| Display On (29h) |
| Tearing Effect Line Off (34h) |
| Idle Mode Off (38h) |
| Idle Mode On (39h) |

A Short Packet (SPa) is defined as:

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 00 0101b.
- Packet Data (PD):
 - Data 0: “Sleep In (10h)”, Display Command Set (DCS).
 - Data 1: Always 00hex.
- Error Correction Code (ECC).

Display Command Set (DCS) Write, No Parameter (DSCWN-S) – Example

5.4.4.3 Display Command Set (DCS) Write, 1 Parameter (DSCW1-S)

“Display Command Set (DCS) Write, 1 Parameter” (DSCW1-S), which is defined in Data Type (DT, 01 0101b), is always used in a Short Packet (SPa) from the MCU to the display module. These commands are defined in the table below.

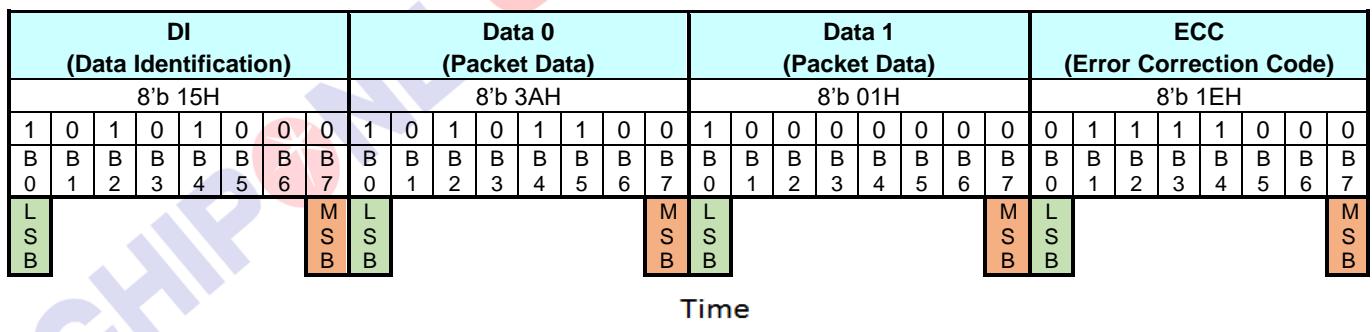

DSCW1-S Commands

| Command |
|-----------------------|
| Gamma Curve Set (26h) |
| TEON (35h) |
| MADCTR (36h) |
| COLMOD (3Ah) |
| WRDISBV (51h) |
| WRCTRLD (53h) |
| WRCABC (55h) |
| WRCABCM (5Eh) |

Short Packet (SPa) is defined e.g.

- Data Identification (DI):
 - Virtual Channel (VC, DI[7...6]): 00b.
 - Data Type (DT, DI[5...0]): 01 0101b.
- Packet Data (PD):
 - Data 0: “PMCSET (3Ah)”, Display Command Set (DCS).
 - Data 1: 01hex, Parameter of the DCS.
- Error Correction Code (ECC).

This is defined on the Short Packet (SPa) as follows.

Display Command Set (DCS) Write, 1 Parameter (DSCW1-S) – Example

5.4.4.4 Display Command Set (DCS) Write, Long (DCSW-L)

“Display Command Set (DCS) Write Long” (DCSW-L), which is defined in Data Type (DT, 11 1001b), is always used in a Long Packet (LPa) from the MCU to the display module. Command (No Parameters) and Write (1 or more parameters) are defined in a table below.

DCSW-L Commands

| Command |
|--|
| NOP (00h) Note 1 |
| Software Reset (01h), Note 1 |
| Sleep In (10h) , Note 1 |
| Sleep Out (11h) , Note 1 |
| Normal Display Mode On (13h) , Note 1 |
| INVOFF (21h) , Note 1 |
| INVOOn (22h) , Note 1 |
| All Pixel Off (22h) , Note 1 |
| All Pixel On (23h) , Note 1 |
| GAMSET (26h) , Note 2 |
| Display Off (28h) , Note 1 |
| Display On (29h) , Note 1 |
| Tearing Effect Line Off (34h) , Note 1 |
| Tearing Effect Line On (35h) , Note 2 |
| MADCTR (36h) |
| Idle Mode Off (38h) , Note 1 |
| Idle Mode On (39h) , Note 1 |
| COLMOD (3Ah) , Note 2 |
| Tearline (44h) |
| WRDISBV (51h) , Note 2 |
| WRCTRLD (53h) |
| WRCABC (55h) , Note 2 |
| WRCABCMB (5Eh) |

Notes 1. Also Long Packet (LPa) can be used; See Display Command Set (DCS) Write, No Parameter.

Notes 2. Also Long Packet (LPa) can be used; See Display Command Set (DCS) Write, 1 Parameter.

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI):
 - Virtual Channel (VC, DI[7...6]): 00b.
 - Data Type (DT, DI[5...0]): 11 1001b.
- Word Count (WC):
 - Word Count (WC): 0001h.
- Error Correction Code (ECC).
- Packet Data (PD):
 - Data 0: “Sleep In (10h)”, Display Command Set (DCS).
- Packet Footer (PF).

This is defined on the Long Packet (LPA) as follows.

| DI (Data Identification) | | | | | | | | WC - LSB (Word Count – LSB) | | | | | | | | WC – MSB (Word Count – MSB) | | | | | | | | ECC (Error Correction Code) | | | | | | | | | | |

Display Command Set (DCS) Write, Long (DCSWL-S) with DCS Only- Example

A Long Packet (LPA) with one Write (1 parameter) is defined as:

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 11 1001b.
- Word Count (WC):
 - Word Count (WC): 0002h.
- Error Correction Code (ECC).
- Packet Data (PD):
 - Data 0: "Gamma Set (26h)", Display Command Set (DCS).
 - Data 1: 01hex, Parameter of the DCS.
- Packet Footer (PF).

Display Command Set (DCS) Write, Long with DCS and 4 Parameter – Example

CHIPONE

5.4.4.5 Display Command Set (DCS) Read, No Parameter (DCSRN-S)

“Display Command Set (DCS) Read, No Parameter” (DCSRN-S), which is defined in Data Type (DT, 00 0110b), is always used in a Short Packet (SPa) from the MCU to the display module. These commands are defined in the table below.

DCSRN-S Commands

| Command |
|-----------------|
| RDDID (04h) |
| RDDPM (0Ah) |
| RDDMADCTR (0Bh) |
| RDDCOLMOD (0Ch) |
| RDDIM (0Dh) |
| RDDSM (0Eh) |
| RDDSDR (0Fh) |
| GSL (45h) |
| RDDISBV (52h) |
| RDCTRLD (54h) |
| RDCABC (56h) |
| RDCABCMB (5Fh) |
| RDID1 (DAh) |
| RDID2 (DBh) |
| RDID3 (DCh) |

The MCU has to define to the display module the maximum size of the returned packet. The command, which is used for this purpose, is “Set Maximum Return Packet Size” (SMRPS-S), which Data Type (DT) is 11 0111b and is used in a Short Packet (SPa) before the MCU can send “Display Command Set (DCS) Read, No Parameter” to the display module. This sequence is illustrated for reference purposes below.

- Step1

The MCU sends “Set Maximum Return Packet Size” (Short Packet (SPa)) (SMRPS-S) to the display module when it wants to return one byte from the display module.

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 11 0111b.
- Maximum Return Packet Size (MRPS)
 - Data 0: 01h.
 - Data 1: 00h.
- Error Correction Code (ECC).

| DI (Data Identification) | | | | | | | | MRPS – LSB | | | | | | | | MRPS – MSB | | | | | | | | ECC (Error Correction Code) | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|------------|---|---|---|---|---|---|---|------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|---|
| 8'b 37H | | | | | | | | 8'b 01H | | | | | | | | 8'b 00H | | | | | | | | 8'b 1DH | | | | | | | | |
| 1 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 |

Time →

Set Maximum Return Packet Size (SMRPS-S) – Example

- Step 2

The MCU wants to receive the value of the “Read ID1 (DAh)” from the display module when the MCU sends “Display Command Set (DCS) Read, No Parameter” to the display module.

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 00 0110b.
- Packet Data (PD):
 - Data 0: “Read ID1 (DAh)”, Display Command Set (DCS).
 - Data 1: Always 00hex.
- Error Correction Code (ECC).

| DI (Data Identification) | | | | | | | | Data 0 (DCS) | | | | | | | | Data 1 (Always 8'b 00H) | | | | | | | | ECC (Error Correction Code) | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|-----------------|---|---|---|---|---|---|---|----------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|---|
| 8'b 06H | | | | | | | | 8'b DAH | | | | | | | | 8'b 00H | | | | | | | | 8'b 1FH | | | | | | | | |
| 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |

Time →

Display Command Set (DCS) Read, No Parameter (DCSRN – S) – Example

- Step 3

The display module can send 2 different information to the MCU after Bus Turnaround (BTA):

- 1) An acknowledge with Error Report (AwER), which is used in a Short Packet (SPa), if there is an error when receiving a command. See the section “Acknowledge with Error Report (AwER)”.
- 2) Information of the received command, which can be a Short Packet (SPa) or a Long Packet (LPa).

5.4.4.6 Null Packet, No Data (NP-L)

“Null Packet, No Data” (NP-L), which is defined in Data Type (DT, 001001b), is always used in a Long Packet (LPa) from the MCU to the display module. The purpose of this command is to keep data lanes in the high speed mode (HSDT) if necessary. The display module can ignore the Packet Data (PD) that the MCU sends.

A Long Packet (LPa) with 5 random data bytes of the Packet Data (PD) is defined as:

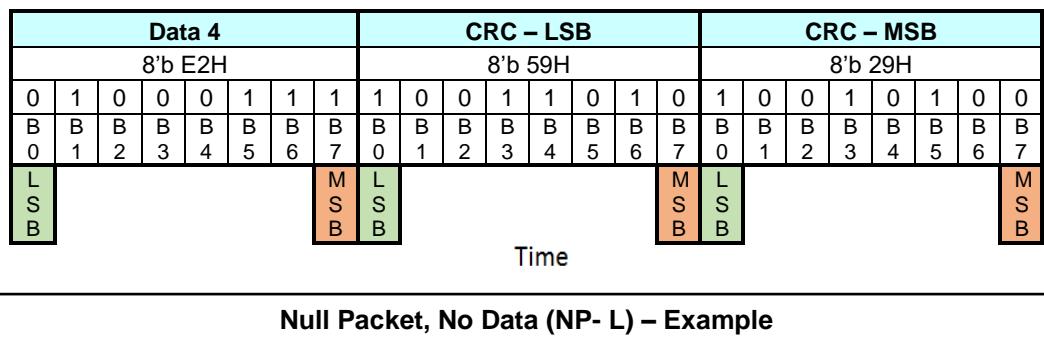

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 001001b.
- Word Count (WC):
 - Word Count (WC): 0005h.
- Error Correction Code (ECC).
- Packet Data (PD):
 - Data 0: 89h (Random data).
 - Data 1: 23h (Random data).
 - Data 2: 12h (Random data).
 - Data 3: A2h (Random data).
 - Data 4: E2h (Random data).
- Packet Footer (PF).

| DI (Data Identification) | | | | | | | | WC – LSB (Word Count – LSB) | | | | | | | | WC – MSB (Word Count – MSB) | | | | | | | | ECC (Error Correction Code) | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|--------------------------------|---|---|---|---|---|---|---|
| 8'b 09H | | | | | | | | 8'b 05H | | | | | | | | 8'b 00H | | | | | | | | 8'b 30H | | | | | | | |

Time

Null Packet, No Data (NP- L) – Example

5.4.4.7 End of Transmission Packet (EoTP)

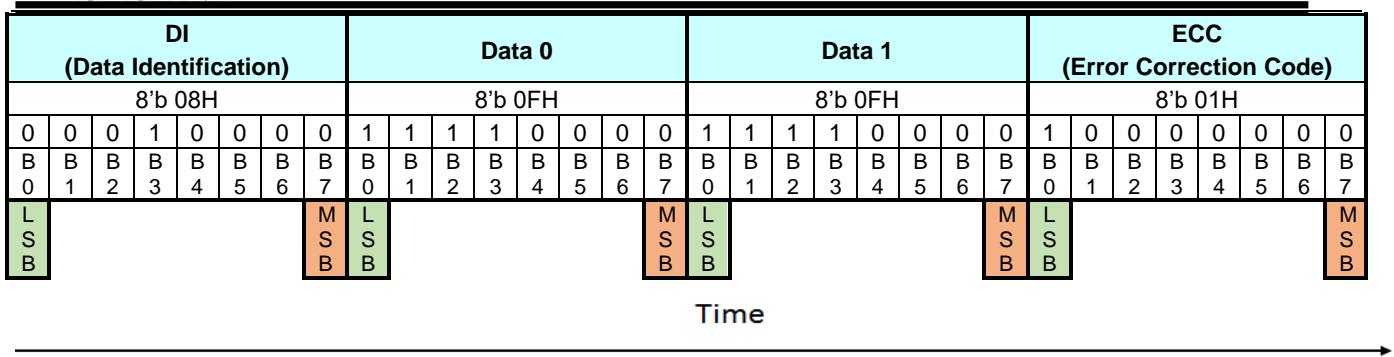

“End of Transmission Packet” (EoTP), which is an interface level function and defined in Data Type (DT, 00 1000b), is always used in a Short Packet (SPa) from the MCU to the display module. The purpose of this command is to terminate the high Speed Data Transmission (HSDT) mode properly when EoTP is added after the last payload packet before “End of Transmission” (EoT).The MCU can decide if it wants to use the “End of Transmission Packet” (EoTP) or not. The display shall have the capability to support both. That is, if the MCU applies the EoTP, it shall report the “DSI Protocol Violation Error” when the EoTP is not detected in the High-Speed (HS). The display module error reporting shall be enabled/disabled statistically, according to the module application. The display module does or does not receive “End of Transmission Packet” (EoTP) from the MCU during the Low Power Data Transmission (LPDT) mode before “Mark-1” (= leaving the Escape mode) which ends the Low Power Data Transmission (LPDT) mode. The display module is not allowed to send “End of Transmission Packet” (EoTP) to the MCU during the Low Power Data Transmission (LPDT) mode. The summary of the receiving and transmitting EoTP is listed below.

The summary of the receiving and transmitting EoTP

| Direction | Display Module (DM) in High Speed Data Transmission (HSDT) | Display Module (DM) in Low Power Data Transmission (LPDT) |
|-----------------------|--|---|
| MCU=> Display Module | Support with and without EoTP | Support with and without EoTP |
| Display Module => MCU | HS mode is not available (EoTP is not available) | EoTP cannot be sent by the Display Module (DM) |

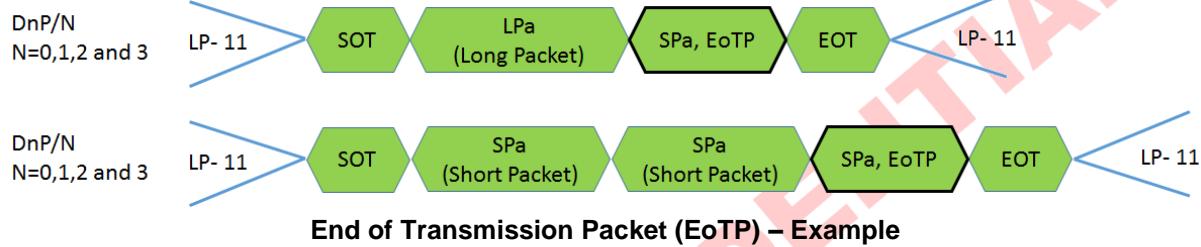

A Short Packet (SPa) using a fixed format is as follows:

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 001000b.
- Packet Data (PD):
 - Data 0: 0Fh.
 - Data 1: 0Fh.
- Error Correction Code.

End of Transmission Packet (EoTP)

Some examples of the “End of Transmission Packet” (EoTP) are illustrated for reference purposes below.

5.4.4.8 Acknowledge with Error Report (AwER)

“Acknowledge with Error Report” (AwER), which is defined in Data Type (DT, 00 0010b), is always used in a Short Packet (SPA) from the display module to the MCU. The Packet Data (PD) can include bits, which define the current error, when the corresponding bit is set to 1, as defined in the following table.

Acknowledge with Error Report

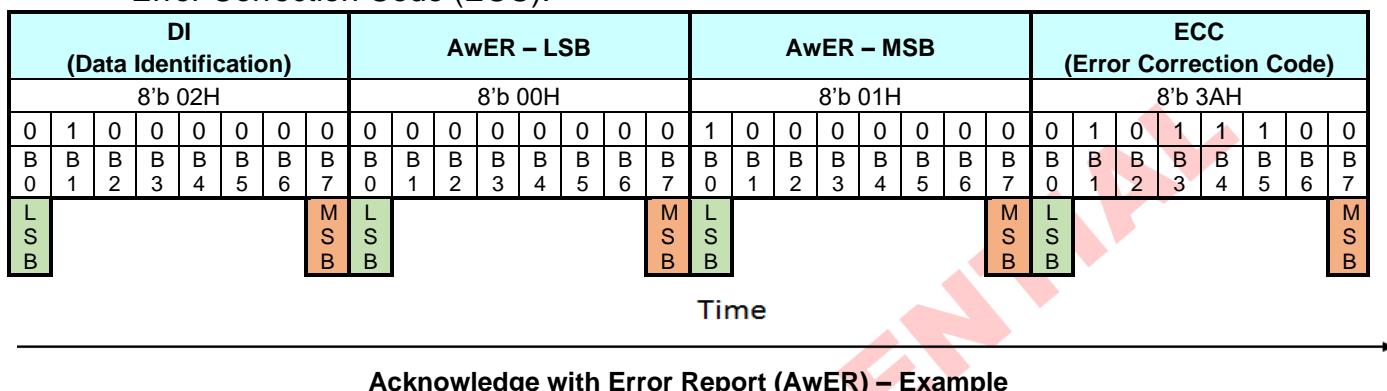

| Bit | Description |
|-----|--|
| 0 | SoT Error |
| 1 | SoT Sync Error |
| 2 | EoT Sync Error |
| 3 | Escape Mode Entry Command Error |
| 4 | Low-Power Transmit Sync Error |
| 5 | Any Protocol Timer Time-Out |
| 6 | False Control Error |
| 7 | Contention is Detected on the Display Module |
| 8 | ECC Error, single-bit (detected and corrected) |
| 9 | ECC Error, multi-bit (detected, not corrected) |
| 10 | Checksum Error (Long Packet only) |
| 11 | DSI Data Type (DT) Not Recognized |
| 12 | DSI Virtual Channel (VC) ID Invalid |
| 13 | Invalid Transmission Length |
| 14 | Reserved, Set to 0 internally |
| 15 | DSI Protocol Violation |

These errors are included in all packages that have been received from the MCU to the display module before the Bus Turnaround (BTA). The display module ignores the received

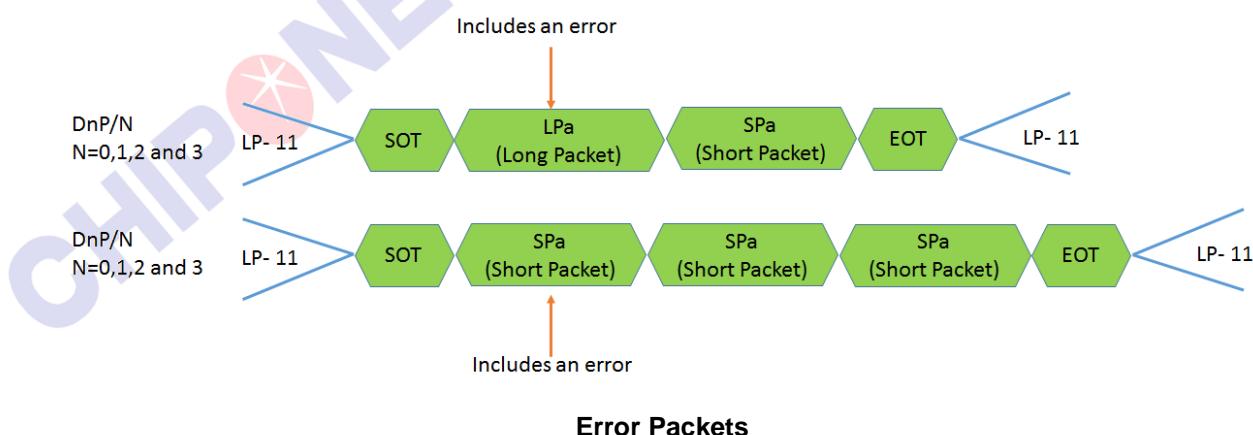

packet which includes error or errors.

Acknowledge with Error Report (AwER) of a Short Packet (SPa) is defined as:

- Data Identification (DI):
 - Virtual Channel (VC, DI [7...6]): 00b.
 - Data Type (DT, DI [5...0]): 000010b.
- Packet Data (PD):
 - Bit 8: ECC Error, single-bit (detected and corrected).
 - AwER: 0100h.
- Error Correction Code (ECC).

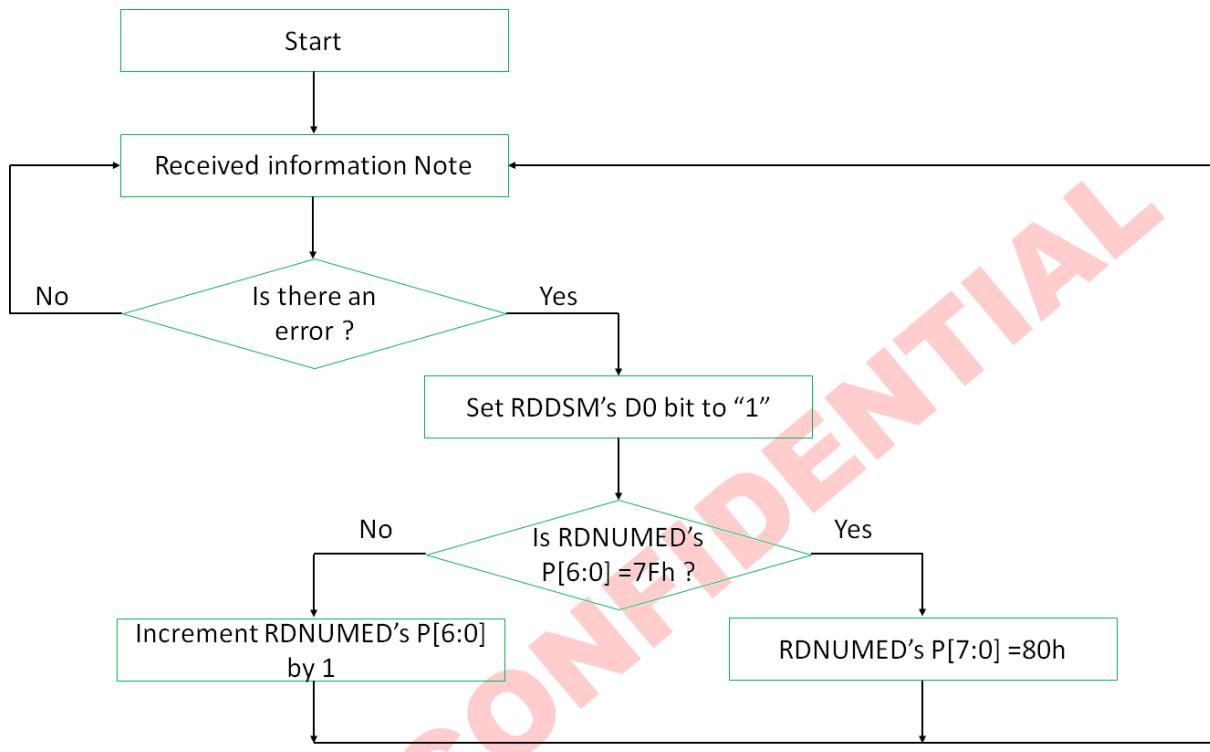

It is possible that the display module receives several packets, which include errors, from the MCU before the MCU performs the Bus Turnaround (BTA). Some examples are illustrated for reference purposes below.

Therefore, a method is needed to check if there are errors in the previous packets. These errors of the previous packets can be detected by “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands. The bit D0 of the “Read Display Signal Mode (0Eh)” command will be set to 1 if a received packet includes an error. The amount of packets,

which include an **ECC** or **CRC** error, is calculated in the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command. This command also sets the RDNUMED register to 00h and set the bit D0 of the “Read Display Signal Mode (0Eh)” command to 0 after the MCU has read the RDNUMED register from the display module. The functionality of the RDNUMED register is illustrated for reference purposes below.

Flow Chart for Errors on DSI

Notes 1. This information can be Interface or Packet Level Communication, but it is always from the MCU to the display module.

Notes 2. CRC or ECC error

5.4.4.9 DCS Read Long Response (DCSRR-L)

“DCS Read Long Response” (DCSRR-L), which is defined in Data Type (DT, 011100b), is always used in a Long Packet (LPa) from the display module to the MCU. “DCS Read Long Response” (DCSRR-L) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module.

A Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), defined as:

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
- Data Type (DT, DI [5...0]): 01 1100b
- Word Count (WC)
- Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
- Data 0: 89hex
- Data 1: 23hex
- Data 2: 12hex
- Data 3: A2hex
- Data 4: E2hex
- Packet Footer (PF)

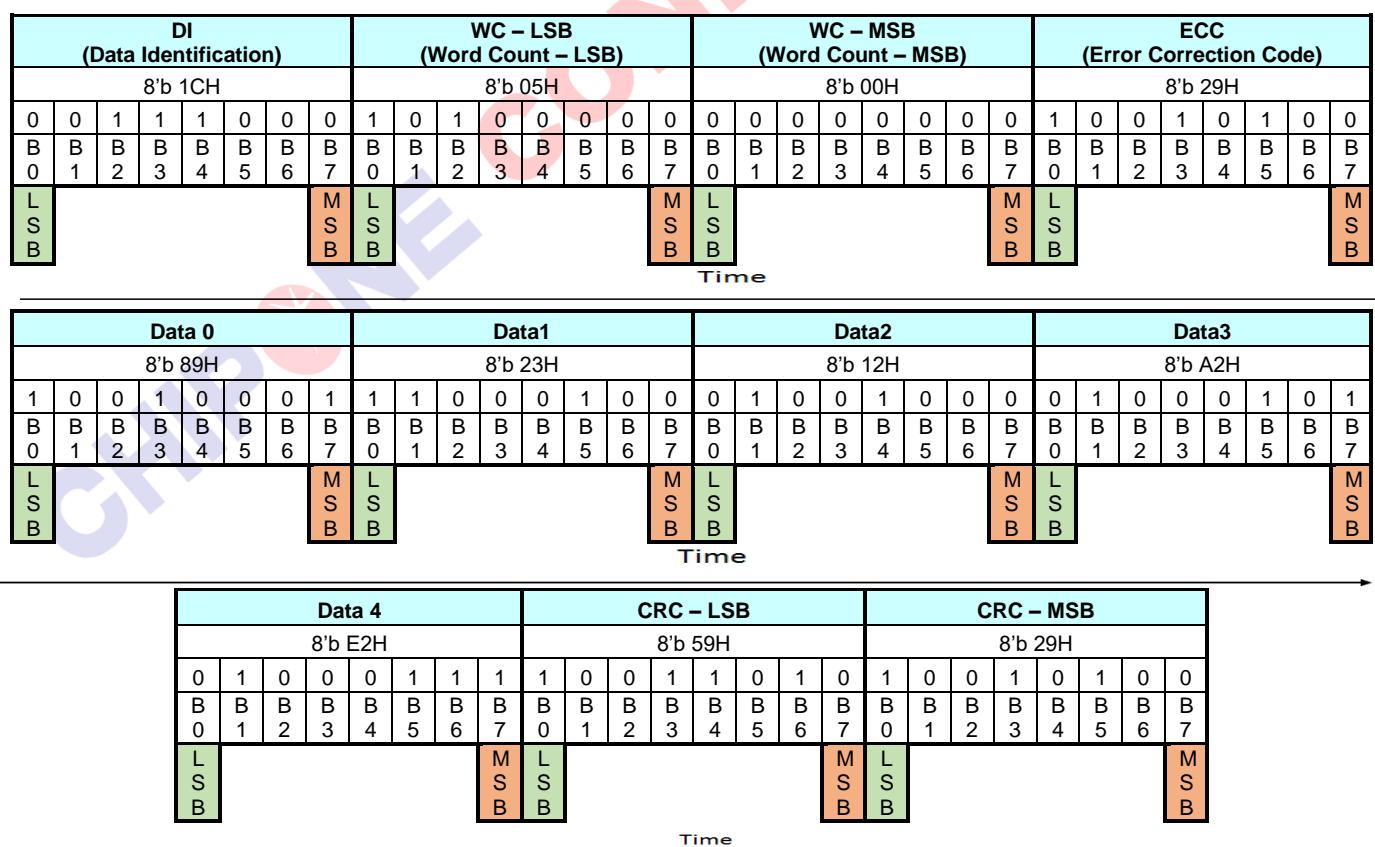

Figure 5-1 DCS Read Long Response (DCSRR-L) – Example

5.4.4.10 DCS Read Short Response, 1 Byte Returned (DCSRR1-S)

“DCS Read Short Response, 1 Byte Returned” (DCSRR1-S), which is defined in Data Type (DT, 10 0001b), is always used in a Short Packet (SPa) from the display module to the MCU. “DCS Read Short Response, 1 Byte Returned (DCSRR1-S) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module.

A Short Packet (SPa) is defined as:

- Data Identification (DI).
- Virtual Channel (VC, DI [7...6]): 00b.
- Data Type (DT, DI [5...0]): 100001b.
- Packet Data (PD).
- Data 0: 45h.
- Data 1: 00h (Always).
- Error Correction Code (ECC).

| DI (Data Identification) | | | | | | | | Data0 (Packet Data) | | | | | | | | Data1 (Always 8'b 00h) | | | | | | | | ECC (Error Correction Code) | | | | | | | | | | |

DCS Read Short Response, 1Byte Return (DCSRR1-S) – Example

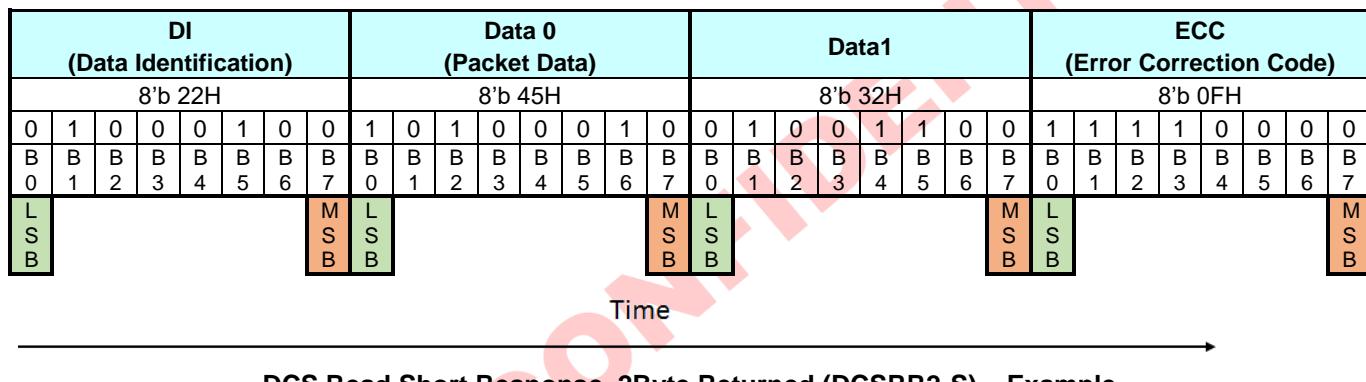

CHIPONE
STAR

5.4.4.11 DCS Read Short Response, 2 Byte Returned (DCSRR2-S)

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S), which is defined in Data Type (DT, 10 0010b), is always used in a Short Packet (SPa) from the display module to the MCU. “DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module.

A Short Packet (SPa) is defined as:

- Data Identification (DI).
- Virtual Channel (VC, DI [7...6]): 00b.
- Data Type (DT, DI [5...0]): 10 0010b.
- Packet Data (PD)
- Data 0: 45h.
- Data 1: 32h.
- Error Correction Code (ECC).

5.4.5 Communication Sequences

5.4.5.1 General

The communication sequences can be done on interface or packet levels between the MCU and the display module. See sections “Interface Level Communication” and “Packet Level Communication”. This communication sequence description is for DSI data lanes (D0P/N and D1P/N), and it is assumed that the needed low level communication is done on DSI Clock lane (CLKP/N) automatically. See the section “DSI CLK Lanes”. Functions of the interface level communication are described in the following table.

Interface Level Communication

| Interface Mode | Abbreviation | Interface Action Description |
|----------------|--------------|--------------------------------------|
| Low Power | LP-11 | Stop state |
| | LPDT | Low power data transmission |
| | ULPS | Ultra- Low power state |
| | RAR | Remote application reset |
| | TEE | Tearing effect event (Not supported) |
| | ACK | Acknowledge (No error) |
| | BTA | Bus turnaround |
| High Speed | HSDT | High speed data transmission |

Functions of the packet level communication are described on the following table.

Packet level communication

| Packet Sender | Abbreviation | Packet Size | Packet Description |
|----------------|--------------|-------------|--------------------------------|
| MCU | DCSW1-S | SPa | DCS Write, 1 Parameter |
| | DCSWN-S | SPa | DCS Write, No Parameter |
| | DCSW-L | LPa | DCS Write, Long |
| | DCSRN-S | SPa | DCS Read, No Parameter |
| | SMRPS-S | SPa | Set maximum return packet size |
| | NP-L | LPa | Null packet, No data |
| Display Module | AwER | SPa | Acknowledge with error report |
| | DCSRR-L | LPa | DCS Read, Long Response |
| | DCSRR1-S | SPa | DCS Read, Short Response |
| | DCSRR2-S | SPa | DCS Read, Short Response |

5.4.5.2 Sequences –DCS Write, 1 Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” is defined on chapter “Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” and example sequences, how this packet is used is described on following tables.

DCS Write,1 parameter Sequence – Example 1

| Line | MCU | | Interface Direction | Display Module | | Comment |
|------|---------------|------------------------|---------------------|------------------------|---------------|---------|
| | Packet Sender | Interface Mode Control | | Interface Mode Control | Packet Sender | |
| 1 | - | LP-11 | → | - | - | Start |
| 2 | DCSW1-S | LPDT | → | - | - | |
| 3 | - | LP-11 | → | - | - | End |

| 22 | - | BTA | ↔/→ | BTA | - | Interface control change from the display module to the MCU |
| 23 | - | LP-11 | → | | - | End |

5.4.5.5 Sequences –Null Packet, No Data Sequence

A Long Packet (LPa) of “Null Packet, No Data (NP-L)” is defined on chapter “Null Packet,

No Data (NP-L)" and example sequences, how this packet is used, is described on following tables.

Null Packet, No Data Sequence – Example

| Line | MCU | | Interface Direction | Display Module | | Comment |
|------|---------------|------------------------|---------------------|------------------------|---------------|--|
| | Packet Sender | Interface Mode Control | | Interface Mode Control | Packet Sender | |
| 1 | - | LP-11 | ➔ | - | - | Start |
| 2 | NP-L | HSDT | ➔ | - | - | Only high speed data transmission is used. |
| 3 | EoTP | HSDT | ➔ | | | End of transmission Packet |
| 4 | - | LP-11 | ➔ | - | - | End |

5.4.5.6 Sequences –End of Transmission Packet

A Short Packet (SPa) of "End of Transmission (EoT)" is defined on chapter "End of Transmission Packet (EoT)" and an example sequences, how this packet is used, is described on following tables.

End of Transmission Packet – Example

| Line | MCU | | Interface Direction | Display Module | | Comment |
|------|---------------|------------------------|---------------------|------------------------|---------------|--|
| | Packet Sender | Interface Mode Control | | Interface Mode Control | Packet Sender | |
| 1 | - | LP-11 | ➔ | - | - | Start |
| 2 | NP-L | HSDT | ➔ | - | - | Only high speed data transmission is used. |
| 3 | EoTP | HSDT | ➔ | | | End of transmission Packet |
| 4 | - | LP-11 | ➔ | - | - | End |

5.4.6 Video Mode Communication

Video Mode peripherals require pixel data delivered in real time. This section specifies the format and timing of DSI traffic for this type of display module.

5.4.6.1 Transmission Packet Sequences

DSI supports several formats, or packet sequences, for Video Mode data transmission. The peripheral's timing requirements dictate which format is appropriate. In the following sections, *Burst Mode* refers to time-compression of the RGB pixel (active video) portion of the transmission. In addition, these terms are used throughout the following sections:

- Non-Burst Mode with Sync Pulses – enables the peripheral to accurately reconstruct original video timing, including sync pulse widths.
- Non-Burst Mode with Sync Events – similar to above, but accurate reconstruction of sync pulse widths is not required, so a single Sync Event is substituted.
- Burst mode – RGB pixel packets are time-compressed, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.

In the following figures the Blanking or Low-Power Interval (BLLP) is defined as a period during which video packets such as pixel-stream and sync event packets are not actively transmitted to the peripheral. To enable PHY synchronization the host processor should periodically end HS transmission and drive the Data Lanes to the LP state. This transition should take place at least once per frame; shown as LPM in the figures in this section. It is recommended to return to LP state once per scan-line during the horizontal blanking time. Regardless of the frequency of BLLP periods, the host processor is responsible for meeting all documented peripheral timing requirements. Note, at lower frequencies BLLP periods will approach, or become, zero, and burst mode will be indistinguishable from non-burst mode.

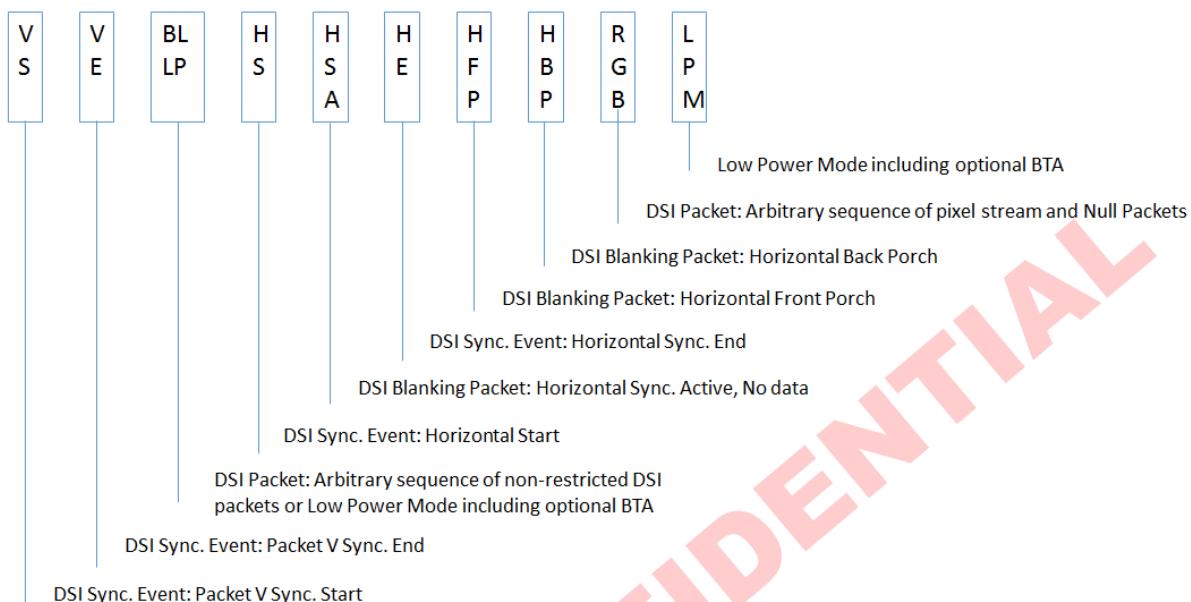

During the BLLP the DSI Link may do any of the following:

- Remain in Idle Mode with the host processor in LP-11 state and the peripheral in LP-RX.
- Transmit one or more non-video packets from the host processor to the peripheral using Escape Mode.
- Transmit one or more non-video packets from the host processor to the peripheral using HS Mode.
- If the previous processor-to-peripheral transmission ended with BTA, transmit one or more packets from the peripheral to the host processor using Escape Mode.
- Transmit one or more packets from the host processor to a different peripheral using a different Virtual Channel ID.

The sequence of packets within the BLLP or RGB portion of a HS transmission is arbitrary. The host processor may compose any sequence of packets, including iterations, within the limits of the packet format definitions. For all timing cases, the first line of a frame shall start with VS; all other lines shall start with HS. This is also true in the special case when VSA+VBP=0. Note that the position of synchronization packets, such as VS and HS, in time is of utmost importance since this has a direct impact on the visual performance of the display panel.

Normally, RGB pixel data is sent with one full scan line of pixels in a single packet. If necessary, a horizontal scan-line of active pixels may be divided into two or more packets. However, individual pixels shall not be split across packets.

Transmission packet components used in the figures in this section are defined in Figure below unless otherwise specified.

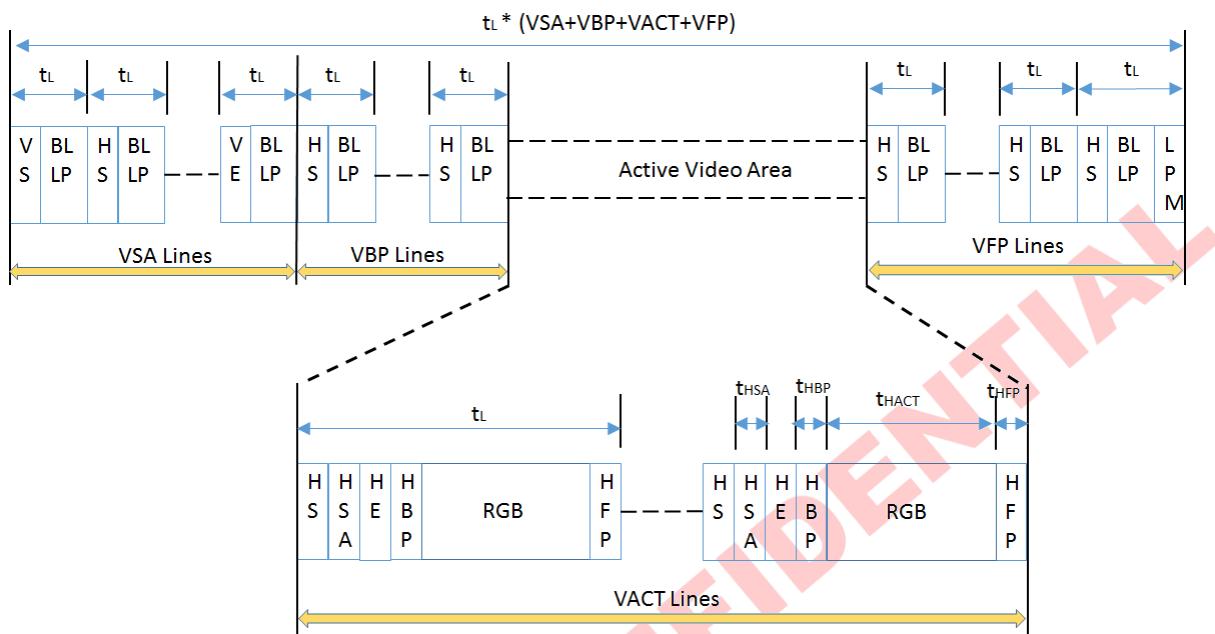

DSI Video Mode Interface Timing Legend

If a peripheral timing specification for HBP or HFP minimum period is zero, the corresponding Blanking Packet may be omitted. If the HBP or HFP maximum period is zero, the corresponding blanking packet shall be omitted.

CHIPONE

5.4.6.2 Non-Burst Mode with Sync Pulses

With this format, the goal is to accurately convey DPI-type timing over the DSI serial Link. This includes matching DPI pixel-transmission rates, and widths of timing events like sync pulses. Accordingly, synchronization periods are defined using packets transmitting both start and end of sync pulses. An example of this mode is shown in figure below.

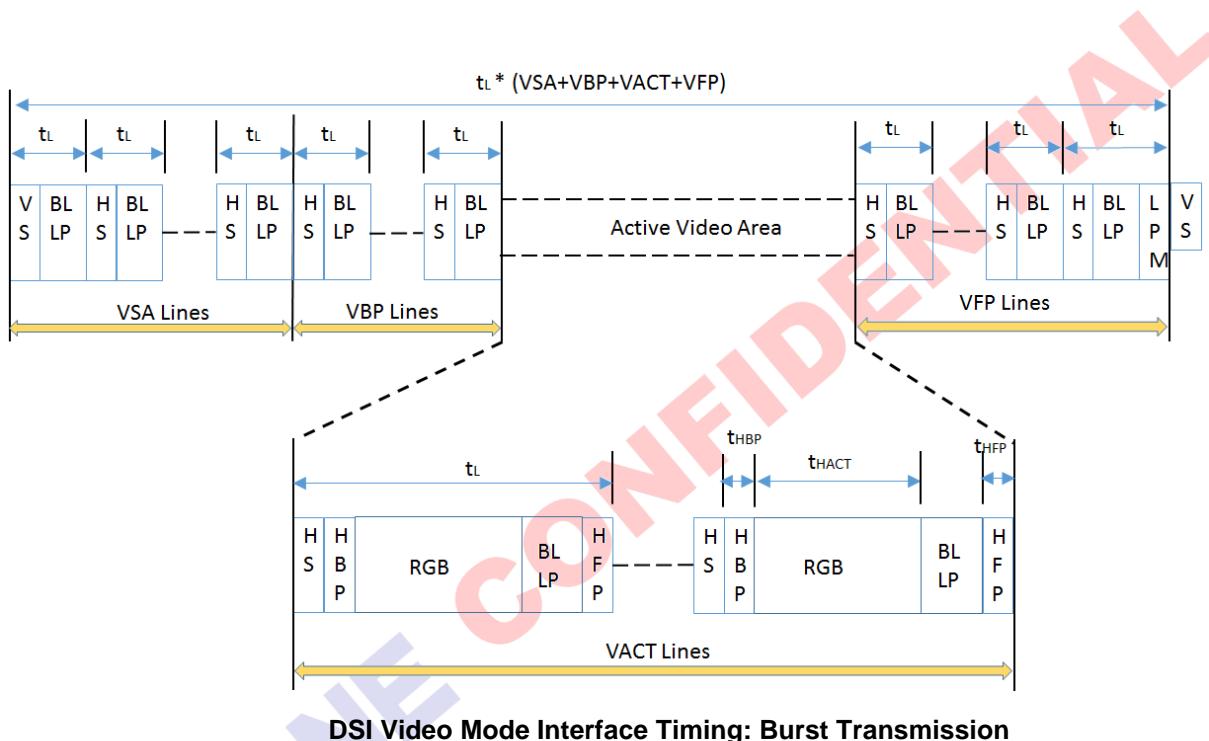

DSI Video Mode Interface Timing: Non-Burst Transmission with Sync Start and End

Normally, periods shown as HSA (Horizontal Sync Active), HBP (Horizontal Back Porch) and HFP (Horizontal Front Porch) are filled by Blanking Packets, with lengths (including packet overhead) calculated to match the period specified by the peripheral's data sheet.

Alternatively, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

5.4.6.3 Burst Mode

In this mode, blocks of pixel data can be transferred in a shorter time using a time-compressed burst format. This is a good strategy to reduce overall DSI power consumption, as well as enabling larger blocks of time for other data transmissions over the Link in either direction. There may be a line buffer or similar memory on the peripheral to accommodate incoming data at high speed. Following HS pixel data transmission, the bus goes to Low Power Mode, during which it may remain idle, i.e. the host processor remains in LP-11 state, or LP transmission may take place in either direction. If the peripheral takes control of the bus for sending data to the host processor, its transmission time shall be limited to ensure data underflow does not occur from its internal buffer memory to the display device. An example of this mode is shown in figure below.

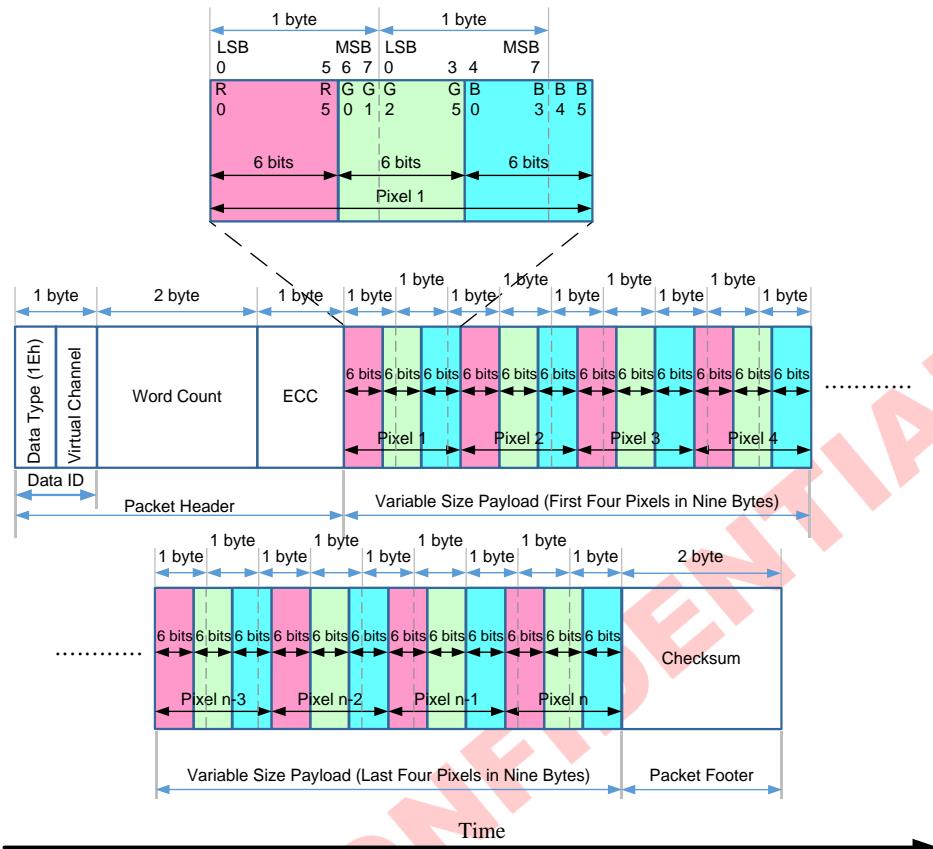

DSI Video Mode Interface Timing: Burst Transmission

Similar to the Non-Burst Mode scenario, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

5.4.7 Display Data Format

5.4.7.1 18-bit per Pixel, Long Packet, Data Type 011110 (1Eh)

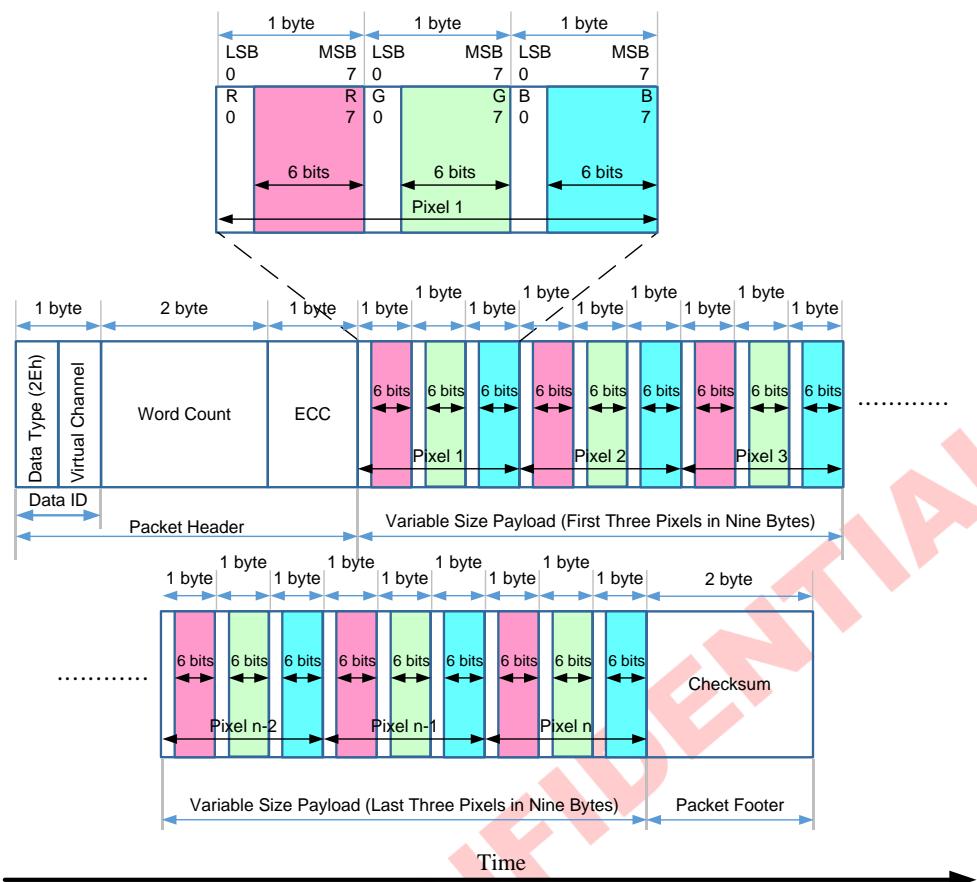

18-bit per Pixel – RGB Color Format, Long Packet

Packed Pixel Stream 18-Bit Format (Packed) is a Long packet. It is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. Pixel format is red (6 bits), green (6 bits) and blue (6 bits), in that order. Within a color component, the LSB is sent first, the MSB last. Note that pixel boundaries only align with byte boundaries every four pixels (nine bytes). Preferably, display modules employing this format have a horizontal extent (width in pixels) evenly divisible by four, so no partial bytes remain at the end of the display line data. If the active (displayed) horizontal width is not a multiple of four pixels, the transmitter shall send additional fill pixels at the end of the display line to make the transmitted width a multiple of four pixels. The receiving peripheral shall not display the fill pixels when refreshing the display device.

For example, if a display device has an active display width of 399 pixels, the transmitter should send 400 pixels in one or more packets. The receiver should display the first 399 pixels and discard the last pixel of the transmission.

With this format, the total line width (displayed plus non-displayed pixels) should be a multiple of four pixels (nine bytes).

5.4.7.2 18-bit per Pixel, Long Packet, Data Type 101110 (2Eh)

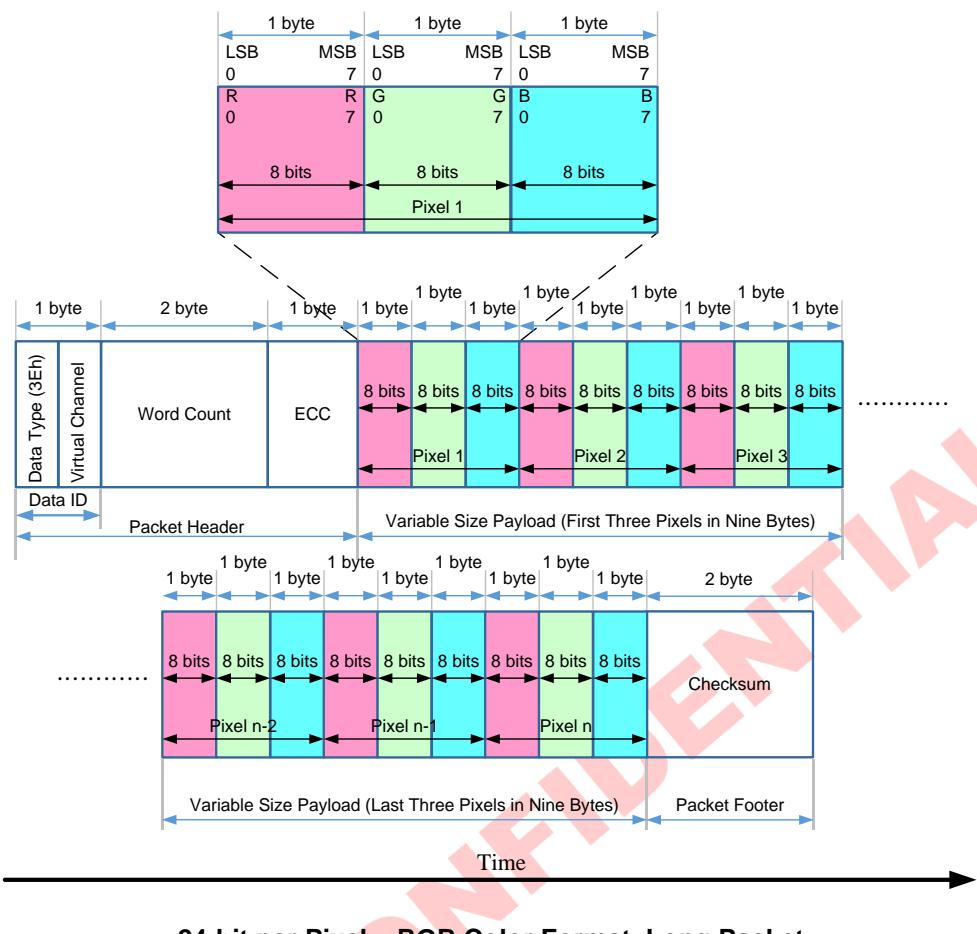

18-bit per Pixel (Loosely Packed) – RGB Color Format, Long Packet

In the 18-bit Pixel Loosely Packed format, each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires three bytes as it is transmitted across the Link. This requires more bandwidth than the “packed” format, but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the Link.

This format is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (6 bits), green (6 bits) and blue (6 bits) in that order. Within a color component, the LSB is sent first, the MSB last. With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

5.4.7.3 24-bit per Pixel, Long Packet, Data Type 111110 (3Eh)

24-bit per Pixel – RGB Color Format, Long Packet

Packed Pixel Stream 24-Bit Format is a Long packet. It is used to transmit image data formatted as 24-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (8 bits), green (8 bits) and blue (8 bits), in that order. Each color component occupies one byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first, the MSB last. With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

5.5 Gamma Function

The structure of grayscale amplifier is shown as below. CO5300 have support Separated Gamma Correction function for R/G/B data.

There are 27 voltage levels between VGMP/VGSP and Gamma GND (VGS), which are determined by the reference adjustment register.

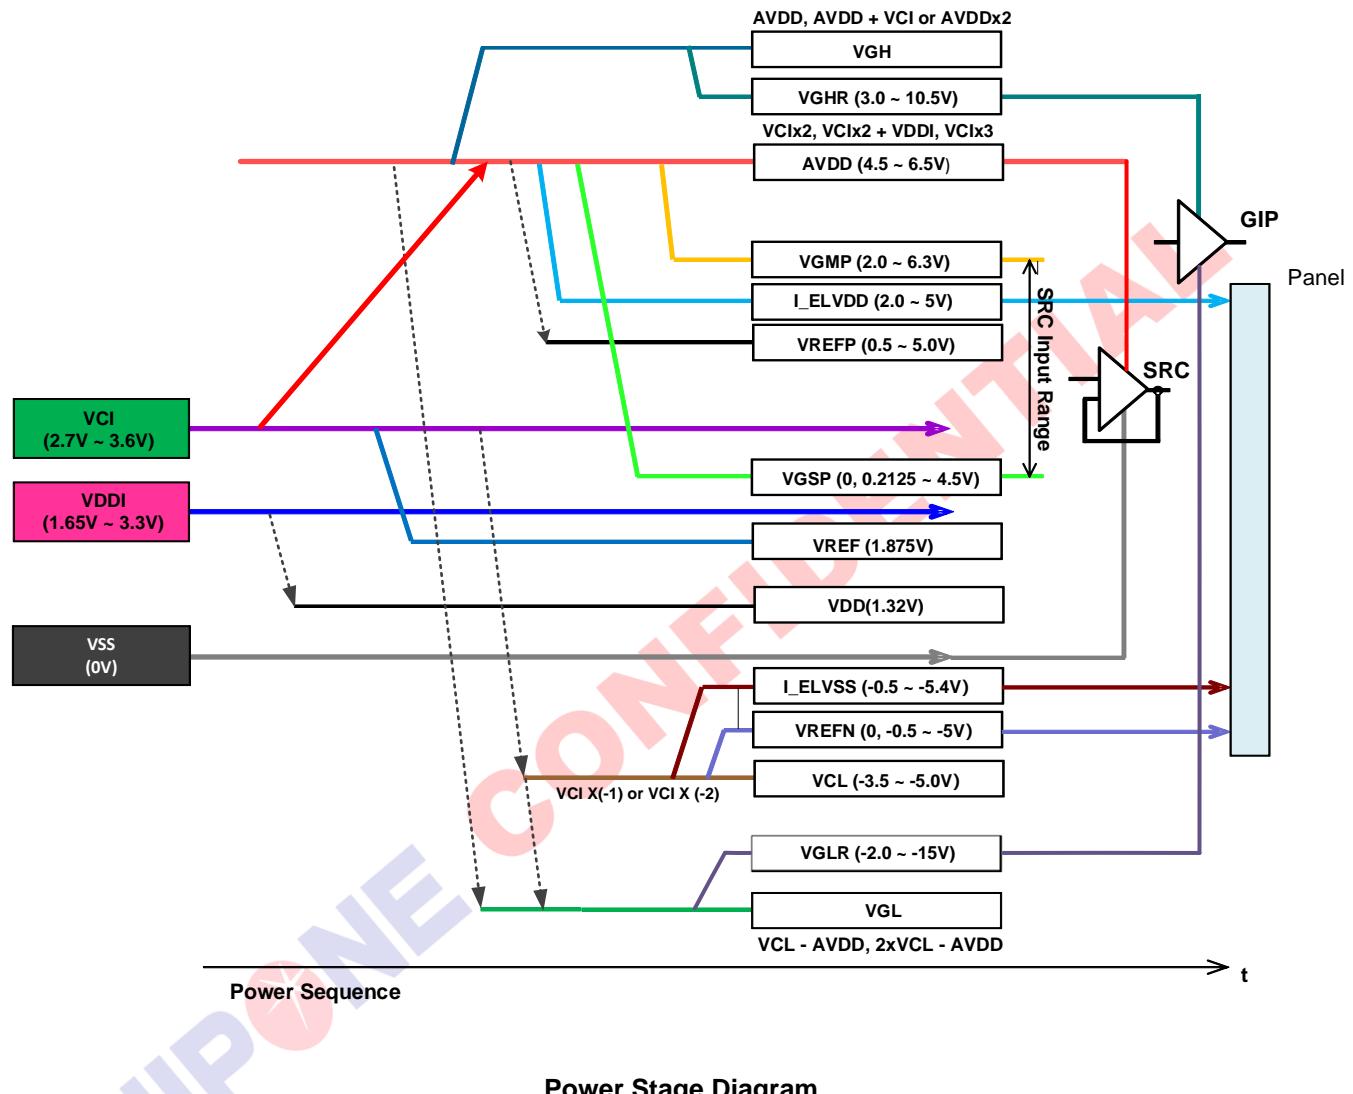

CO5300 Gamma Structure as below:

Gamma register stream and Gamma reference voltage

5.6 Power On/ OFF Sequence

5.6.1 Power Stage Diagram

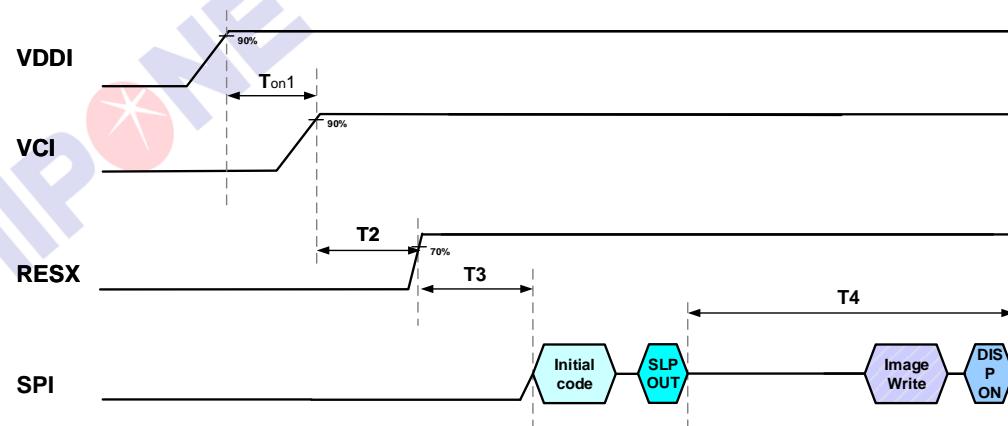

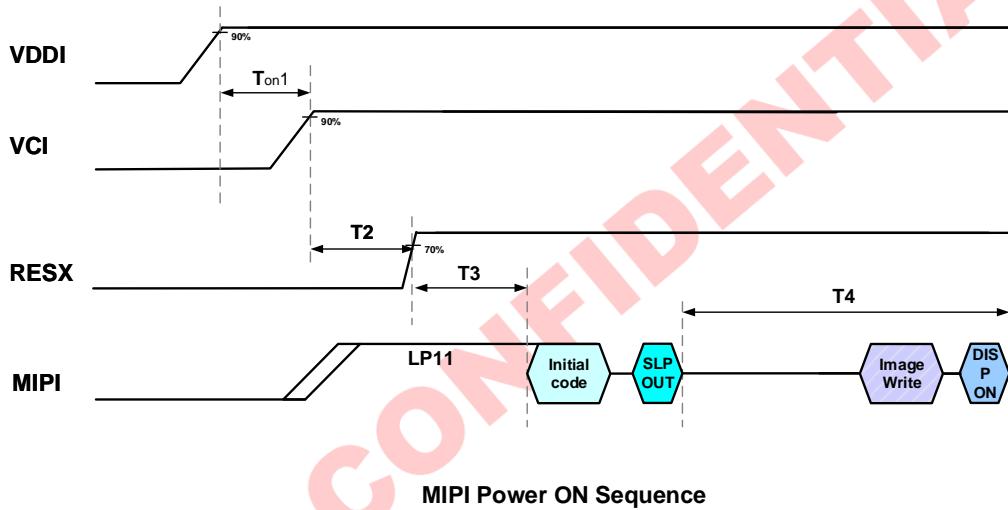

5.6.2 Power ON Sequence

The power on sequence for different power input modes are shown below figures.

Power ON Sequence Timing

| Symbol | Description | Value | | | Unit | Remark |
|------------------|--|-------|------|------|------|--------|
| | | Min. | Typ. | Max. | | |
| T _{on1} | VDDI on to VCI on delay | >0 | | | us | |
| T ₂ | VDDI on to valid to RESET high | 10 | | | ms | |
| T ₃ | RESET high to first command | 10 | | | ms | |
| T ₄ | Sleep-out command received to Display on command received. | 60 | | | ms | |

The Power on sequence is shown as below.

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

Note 2: This power-on sequence is based on adding Schottky diode on VGL pin to ground.

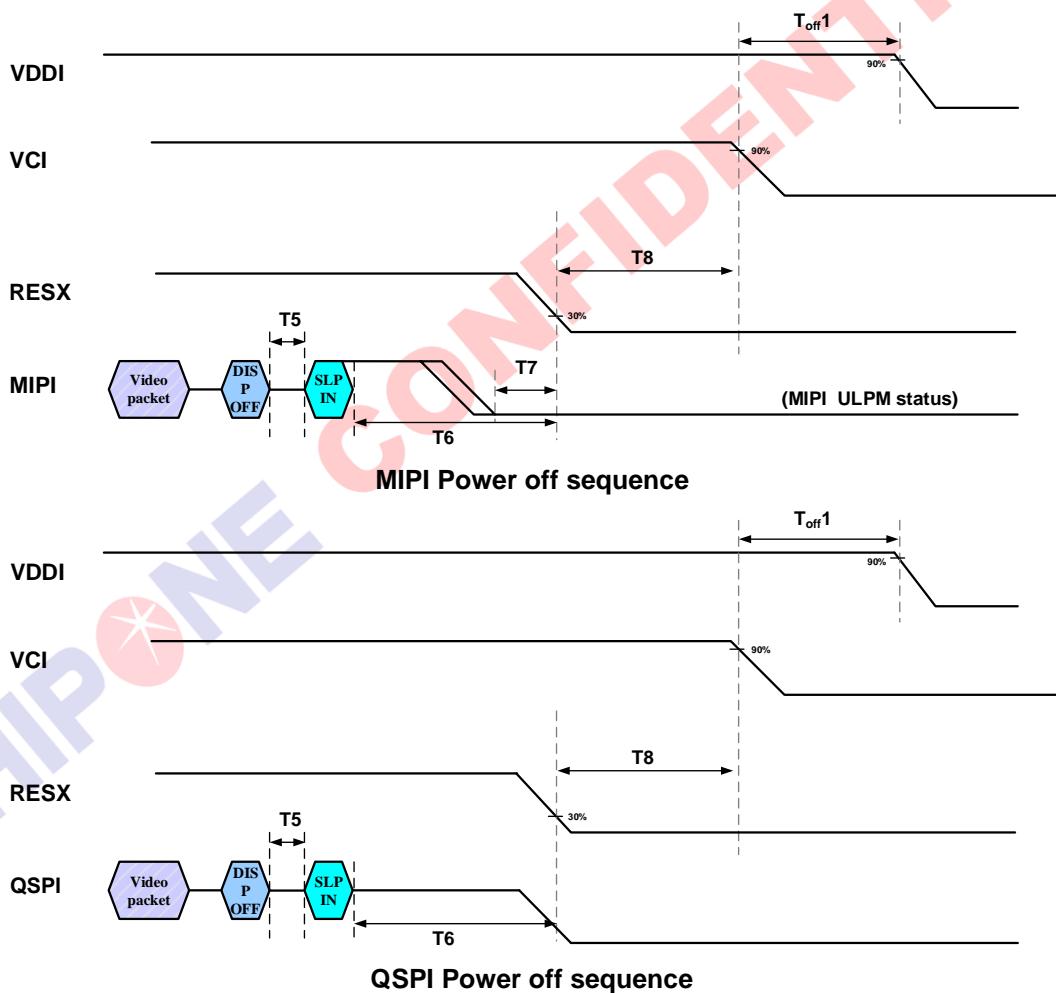

5.6.3 Power OFF Sequence

The power off sequence for different power input modes are shown below figures.

Power OFF Sequence Timing

| Symbol | Description | Value | | | Unit | Remark |
|-------------------|--|-------|------|------|------|--------|
| | | Min. | Typ. | Max. | | |
| T _{off1} | VCI off to VDDI off delay | >0 | | | us | |
| T ₅ | Display-off command received to Sleep-in command delay | >0 | | | us | |
| T ₆ | Sleep-in command received to valid to RESET low | 83 | | | ms | @60Hz |
| T ₇ | MIPI ultra low power mode to valid to RESET low | 0 | | | us | |
| T ₈ | RESET low to VCI off delay | 0 | | | us | |

The power off sequence is shown as below:

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

Note 2: Keep VGH is equal to or larger than VCI during power off sequence.

6. Electrical Characteristics

6.1 Absolute Maximum Ratings

The absolute maximum rating is listed in below table. It may lead permanently damaged when the CO5300 is used out of the absolute maximum rating.

To use the CO5300 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the CO5300 will malfunction and be poor reliability.

Absolute Maximum Ratings List

| Item | Symbol | Rating | | | Unit |
|-----------------------|-------------------------------|---------------------|------|----------|------|
| | | Min. | Typ. | Max. | |
| Power supply voltage | VDDI ~ VSSD | -0.3 | - | +5.5 | V |
| Power supply voltage | VCI (VCIA, VCIC, VCIR) ~ VSSA | -0.3 | - | +5.5 | V |
| Supply voltage | AVDD ~ VSSA | -0.3 | - | +6.6 | V |
| Supply voltage | AVSS ~ VCL | -0.3 | - | +5.0 | V |
| Supply voltage | VGH ~ VGL | $ VGH-VGL \leq 30$ | | | V |
| Operating temperature | Topr | -40 | | +85 | °C |
| Storage temperature | Tstg | -55 | | +125 | °C |
| Input voltage | Vin | -0.3 | | VDDI+0.3 | V |

| Input pulse rejection | SGD | DSI-CLKP/N, DSI-DnP/N | | | 300 | Vps | 1 |

Note 1: Peak interference amplitude max. 200mV and interference frequency min. 450MHz.

6.3.2 DC Characteristics for DSI HS Mode

Condition : $T_a = 25^\circ\text{C}$, $VDDI = 1.65\text{V} \sim 3.3\text{V}$, $VCI = 2.7\text{V} \sim 3.6\text{V}$.

DC Characteristics List for DSI HS Mode

| Parameter | Symbol | Conditions | Specification | | | Unit | Notes |
|--|---------------------------------|---------------|---------------|-----|-----|----------|-------|
| | | | MIN | TYP | MAX | | |
| Input voltage common mode range | V_{CMCLK} V_{CMDATA} | CLKP/N, DnP/N | 70 | | 330 | mV | 1,2 |
| Input voltage common mode variation ($\leq 450\text{MHz}$) | $V_{CMRCLKL}$ $V_{CMRDATAL}$ | CLKP/N, DnP/N | -50 | | 50 | mV | 3 |
| Input voltage common mode variation ($\geq 450\text{MHz}$) | $V_{CMRCLKM}$ $V_{CMRDATAM}$ | CLKP/N, DnP/N | | | 100 | mV | |
| Low-level differential input voltage threshold | V_{THLCLK} $V_{THLDATA}$ | CLKP/N, DnP/N | -70 | | | mV | |
| High-level differential input voltage threshold | V_{THHCLK} $V_{THHDATA}$ | CLKP/N, DnP/N | | | 70 | mV | |
| Single-ended input low voltage | V_{ILHS} | CLKP/N, DnP/N | -40 | | | mV | 2 |
| Single-ended input high voltage | V_{IHHS} | CLKP/N, DnP/N | | | 460 | mV | 2 |
| Differential input termination resistor | R_{TERM} | CLKP/N, DnP/N | 80 | 100 | 125 | Ω | |
| Single-ended threshold voltage for termination enable | V_{TERM_EN} | CLKP/N, DnP/N | | | 450 | mV | |
| Termination capacitor | C_{TERM} | CLKP/N, DnP/N | | | 14 | pF | |

Note 1: Includes 50mV (-50mV to 50mV) ground difference.

Note 2: Without $V_{CMRCLKM}$ / $V_{CMRDATAM}$.

Note3: Without 50mV (-50mV to 50mV) ground difference.

Note4: $D_n = D0$,and $D1$.

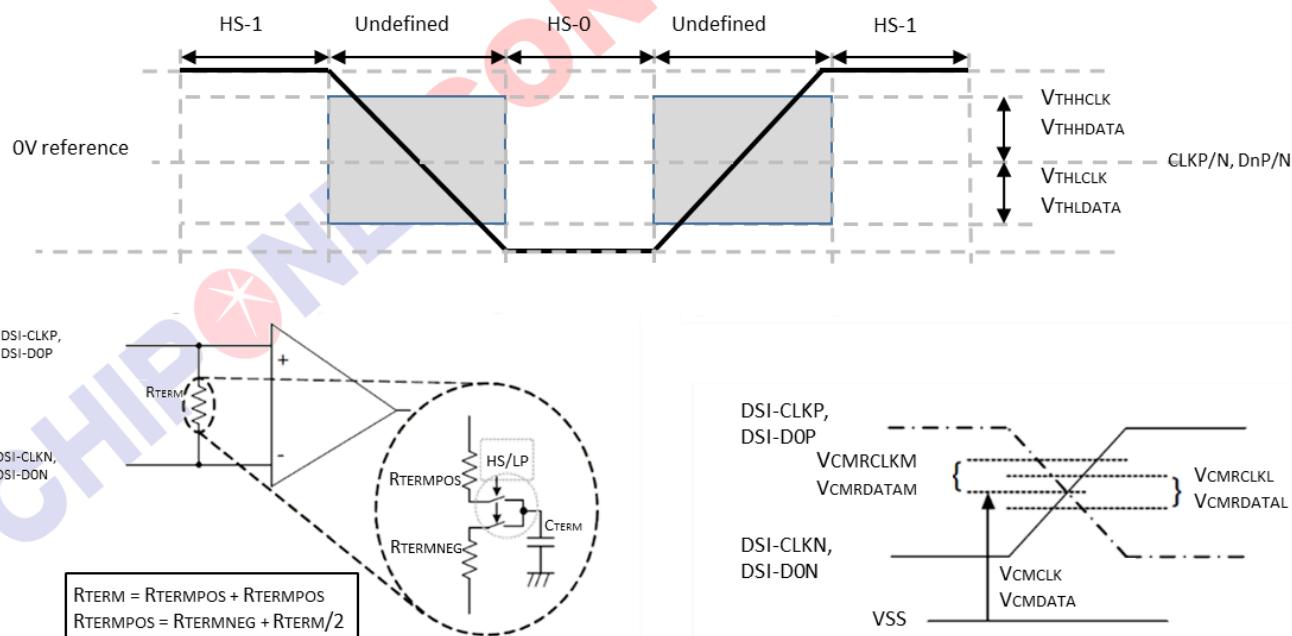

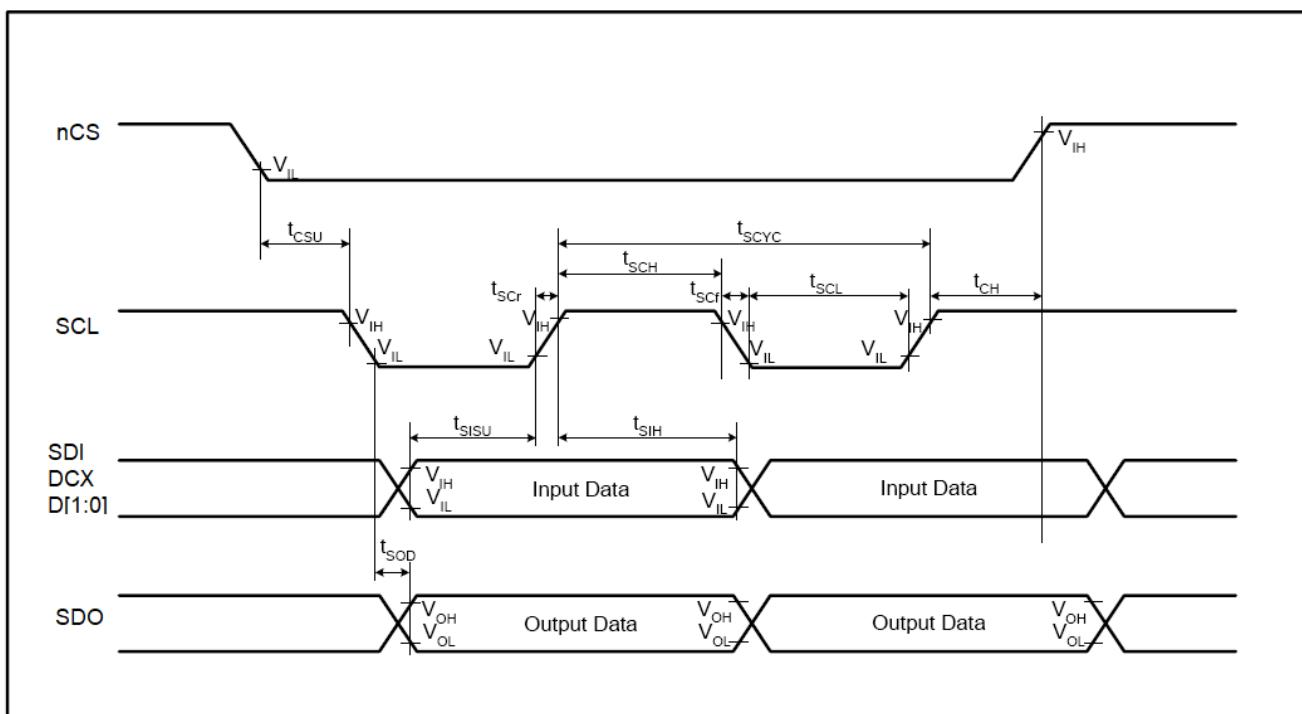

Figure 6-1 Differential voltage range, termination resistor and Common mode voltage

6.4 AC Timings Characteristics

6.4.1 Serial Interface Characteristics (QUAD SPI)

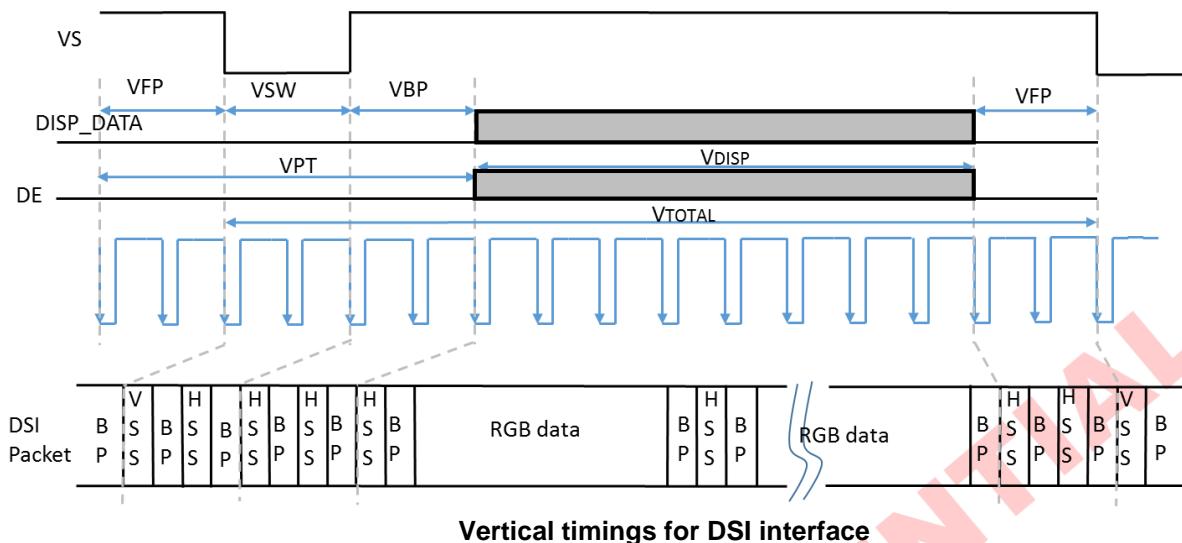

| Parameter | Symbol | Conditions | Specification | | | Unit | Notes |
|----------------------|-------------------|-------------------------------|---------------|-----|-----|------|-------|
| | | | MIN | TYP | MAX | | |
| SCL | T _{SCYC} | Clock cycle (Write) | 20 | - | - | ns | |
| | T _{SCYC} | Clock cycle (Read) | 100 | - | - | ns | |
| | T _{SCH} | Clock "H" pulse width (Write) | 6.5 | - | - | ns | |
| | T _{SCH} | Clock "H" pulse width (Read) | 45 | - | - | ns | |
| | T _{SCL} | Clock "L" pulse width (Write) | 6.5 | - | - | ns | |
| | T _{SCL} | Clock "L" pulse width (Read) | 45 | - | - | ns | |
| | T _{Scr} | Clock rise time | - | - | 3.5 | ns | |
| CSX | T _{csu} | Chip select setup time | 10 | - | - | ns | |
| | T _{ch} | Chip select hold time | 10 | - | - | ns | |
| SDI DCX D[1:0] | T _{sisu} | Data input setup time | 4 | - | - | ns | |
| | T _{sih} | Data input hold time | 4 | - | - | ns | |
| SDO | T _{sod} | Data output setup time | - | - | 45 | ns | |
| | T _{soh} | Data output hold time | 5 | - | - | ns | |

Note 1: Logic high and low levels are specified as 20% and 80% of VDDI for Input signals.

Note 2: Ta = -30 to 85 °C, VDDI=1.65V to 3.3V, VCI=2.7V to 3.6V, GND=0V

Note 3: The max SCL sequence of 4-wire QSPI transferring RGB888, RGB666 and RGB555 is 50Mhz.

6.4.2 Vertical Timings for DSI video mode

Vertical timings for DSI interface

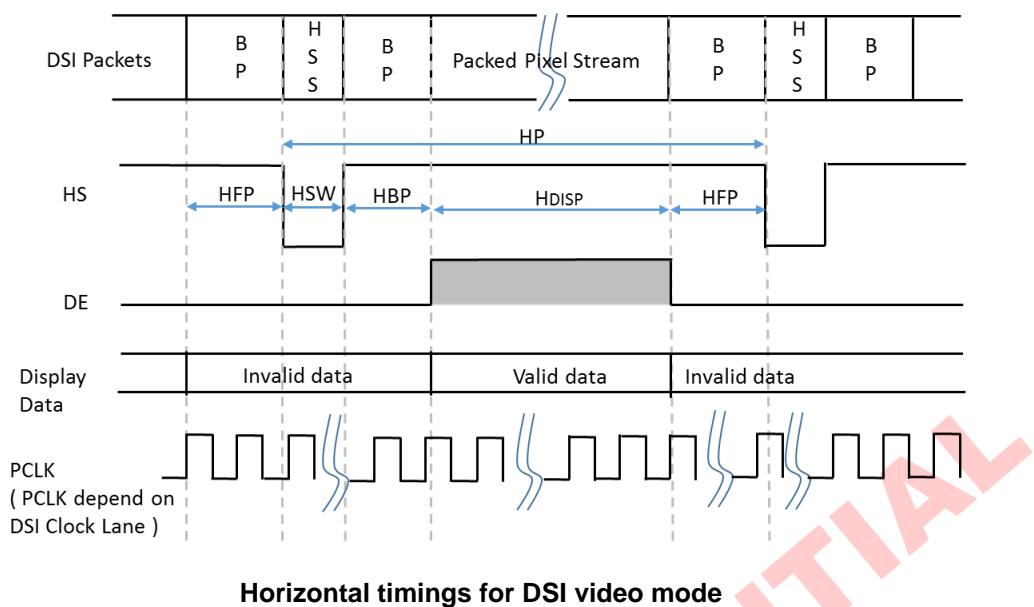

Condition : $T_a = 25^\circ\text{C}$, Resolution = 454(RGB)* 454

Vertical Timings List for DSI video mode

| Parameter | Symbol | Conditions | Specification | | | Unit | Notes |
|---------------------------|--------|-------------|---------------|-----|-----|------|-------|
| | | | MIN | TYP | MAX | | |
| Vertical Total | VTOTAL | | | TBD | | Line | |
| Vertical low pulse width | VSW | | | TBD | | Line | 1 |
| Vertical front porch | VFP | | | TBD | | Line | |
| Vertical back porch | VBP | | | TBD | | Line | 1 |
| Vertical data start point | | VSW+VBP | | TBD | | Line | 1 |
| Vertical blanking period | VPT | VSW+VBP+VFP | | TBD | | Line | |
| Vertical active area | VDISP | | | 454 | | Line | |
| Vertical Frame rate | VFR | | | 60 | | Hz | |

Note 1: The VSW and VBP pulse width are related to GOA timing. The GOA timing must be set at corresponding position for normal display.

6.4.3 Horizontal Timings for DSI video mode

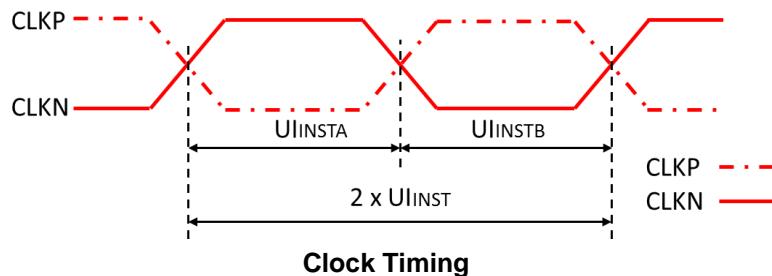

Condition : $T_a = 25^{\circ}\text{C}$, Resolution = 454(RGB)* 454

Horizontal Timings List for DSI video mode

| Parameter | Symbol | Conditions | Specification | | | Unit | Notes |
|-----------------------------|--------|-------------|---------------|-----|-----|------|-------|
| | | | MIN | TYP | MAX | | |
| HS low pulse width | HSW | | | TBD | | nS | |
| Horizontal back porch | HBP | | | TBD | | nS | |
| Horizontal front porch | HFP | | | TBD | | nS | |
| Horizontal data start point | | HSW+HBP | | TBD | | nS | |
| Horizontal blanking period | HBLK | HSW+HBP+HFP | | TBD | | nS | |
| Horizontal active area | Hdisp | | | 454 | | DCLK | |

6.5 MIPI AC Characteristics

6.5.1 High Speed Mode - Clock Timings

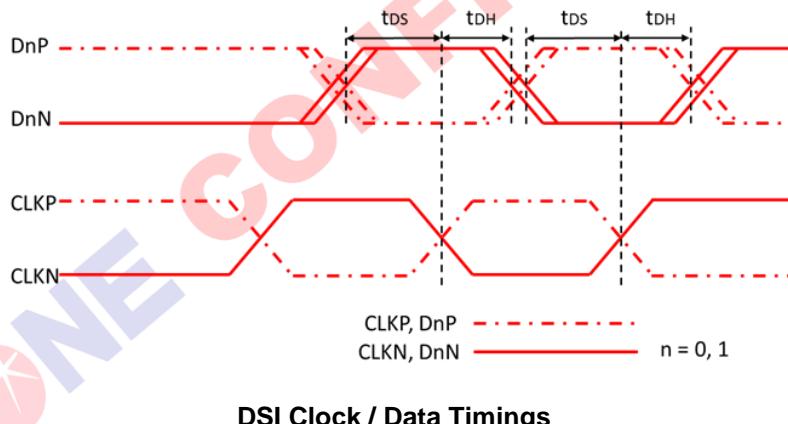

High Speed Mode - Clock Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|---------|------------------|-------------------------|---------------|-----|------|------|-------|
| | | | MIN | TYP | MAX | | |
| CLK P/N | 2xUIINST | Double UI instantaneous | 4 | | 25 | nS | |
| CLK P/N | UIINSTA, UIINSTB | UI instantaneous Half | 2 | | 12.5 | nS | 1 |

Note 1: UI = UIINSTA = UIINSTB.

6.5.2 High Speed Mode - Clock / Data Timings

High Speed Mode - Clock / Data Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|------------------------|--------|--------------------------|---------------|-----|-----|------|-------|
| | | | MIN | TYP | MAX | | |
| Dn P/N (n=0, and1) | tDS | Data to Clock Setup time | 0.15*UI | | | UI | |
| | tDH | Clock to Data Hold time | 0.15*UI | | | UI | |

6.5.3 High Speed Mode - Rising and Falling Timings

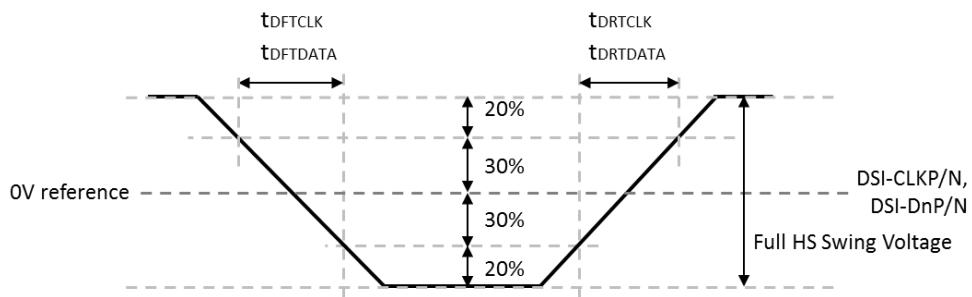

Figure 6-2 Rising and Falling Timings

High Speed Mode - Rising and Falling Timing

| Parameter | Symbol | Conditions | Specification | | | Unit | Notes |
|----------------------------------|----------|------------|---------------|-----|--------|------|-------|
| | | | MIN | TYP | MAX | | |
| Differential Rise Time for Clock | tDRCLK | CLKP/N | 150pS | | 0.3*UI | | 2,3 |
| Differential Rise Time for Data | tDRDATA | DnP/N | 150pS | | 0.3*UI | | 1,2,3 |
| Differential Fall Time for Clock | tDFTCLK | CLKP/N | 150pS | | 0.3*UI | | 2,3 |
| Differential Fall Time for Data | tDFTDATA | DnP/N | 150pS | | 0.3*UI | | 1,2,3 |

Note 1: DnP/N, n =0, and 1.

Note 2: The display module has to meet timing requirements, which are defined for the transmitter (MCU) on MIPI D-PHY standard.

Note 3: DSİ-CLK+ = CLKP.

DSİ-CLK- = CLKN.

DSİ-D0+ = D0P.

DSİ-D0- = D0N.

6.5.4 Low Speed Mode - Bus Turn Around

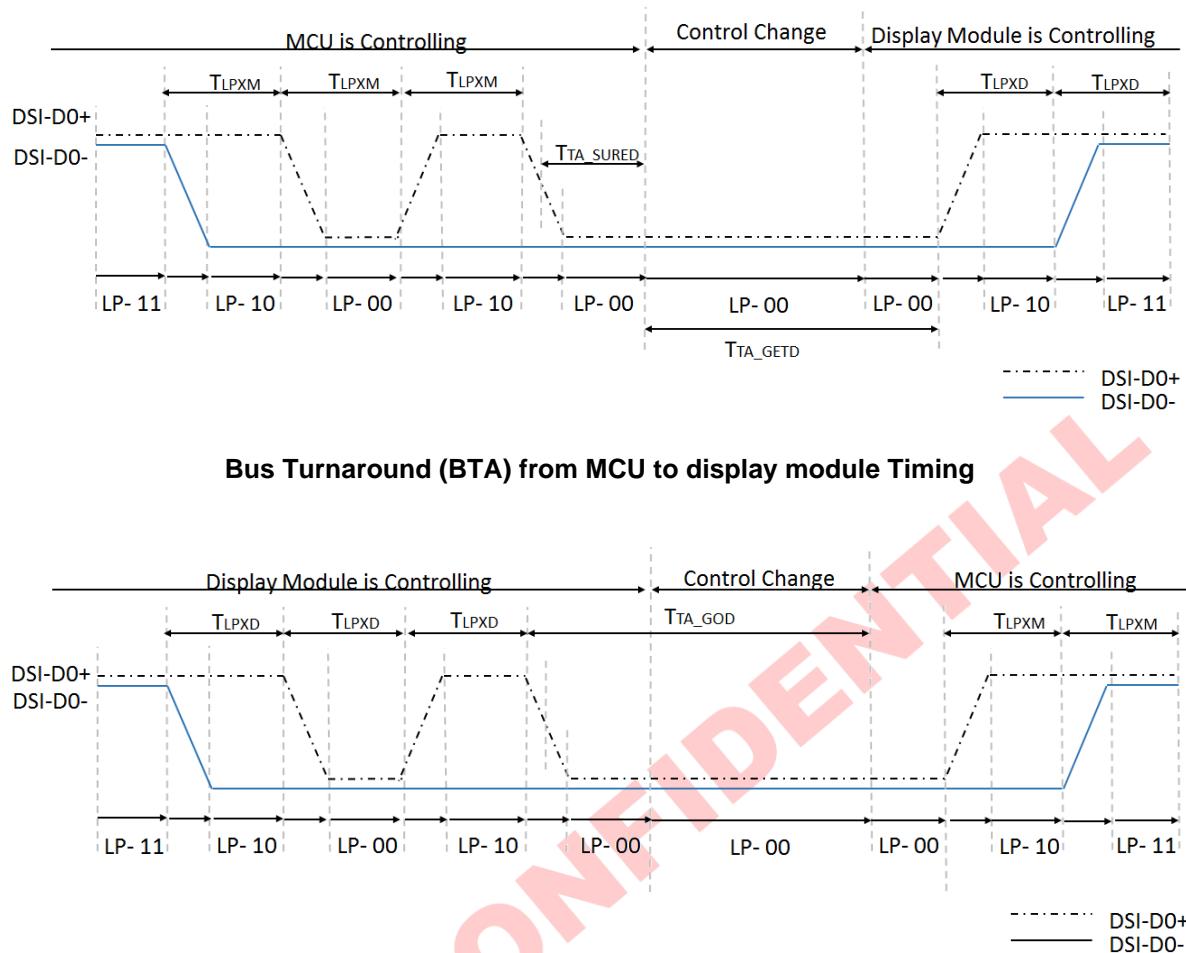

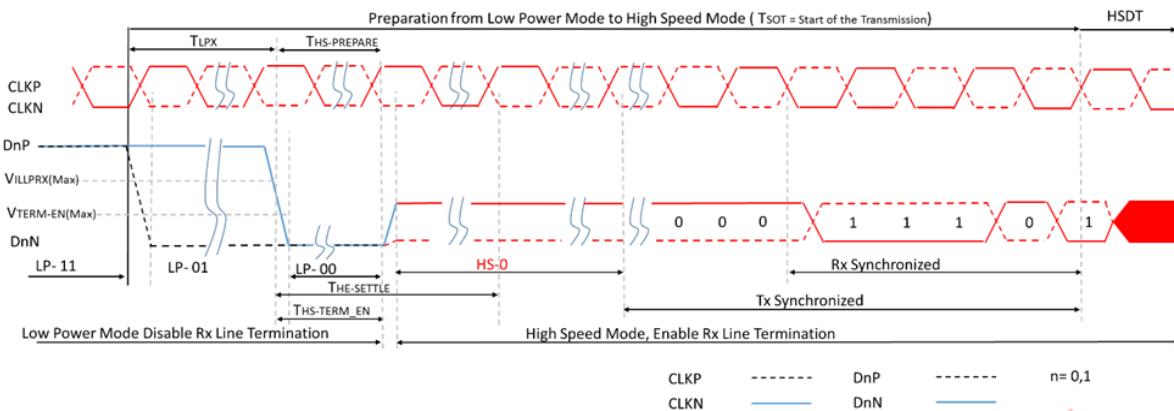

Figure 6-3 Bus Turnaround (BTA) from Display module to MCU Timing

Low Speed Mode - Bus Turn Around Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|--------|-----------------|---|----------------|-----|----------------|------|-------|
| | | | MIN | TYP | MAX | | |
| D0P/N | T_{LPXM} | Length of LP-00,LP-01,LP-10 or LP11 periods MCU to Display Module | 50 | | 75 | nS | 1 |
| D0P/N | T_{LPXD} | Length of LP-00,LP-01,LP-10 or LP11 periods Display Module to MCU | 50 | | 75 | nS | 1 |
| D0P/N | T_{TA_SURED} | Time-out before the Display Module starts driving | T_{LPXD} | | $2 * T_{LPXD}$ | nS | 1 |
| D0P/N | T_{TA_GETD} | Time to drive LP-00 by Display Module | $5 * T_{LPXD}$ | | | nS | 1 |
| D0P/N | T_{TA_GOD} | Time to drive LP-00 after turnaround request -MCU | $4 * T_{LPXD}$ | | | nS | 1 |

Note 1: D0P = DSI-D0+, D0N = DSI-D0-.

6.5.5 Data Lanes from Low Power Mode to High Speed Mode

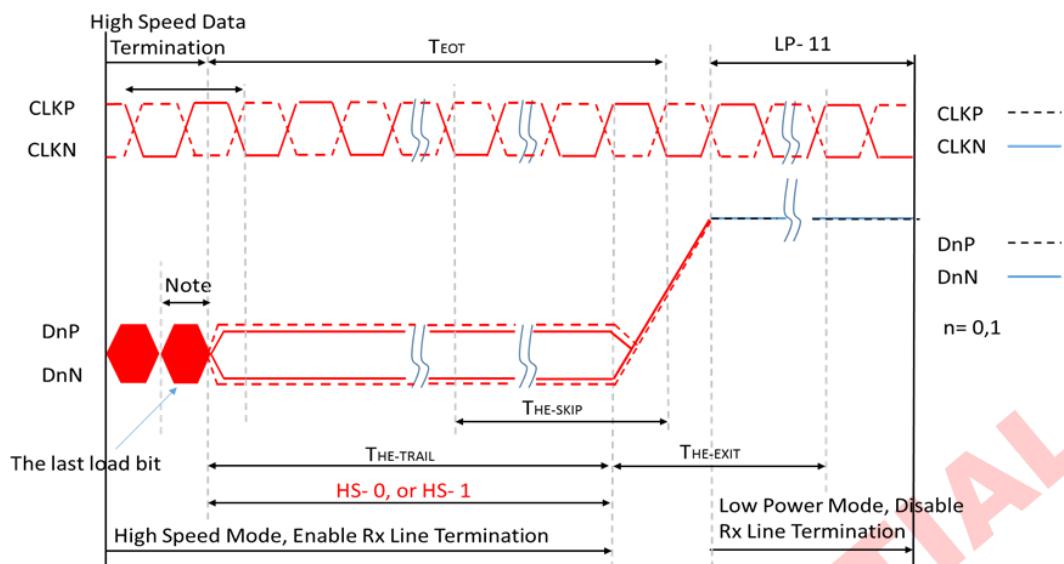

Data Lanes from High Speed Mode to Low Power Mode Timing

Data Lanes from Low Power Mode to High Speed Mode Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|--------|--------------------------|---|---------------|-----|---------|------|-------|
| | | | MIN | TYP | MAX | | |
| DnP/N | T _L PX | Length of any Low Power State Period | 50 | | | nS | 1 |
| DnP/N | T _H S-PREPARE | Time to drive LP-00 to prepare for HS Transmission | 40+4*UI | | 85+6*UI | nS | 1 |
| DnP/N | T _H S-TREM-EN | Time to enable Data lane Receiver line termination measured from when Dn crosses VILMAX | | | 35+4*UI | nS | 1 |

Note 1: DnP/N, n=0, and 1

6.5.6 Data Lanes from High Speed Mode to Low Power Mode

Note:
If the last load bit is HS- 0, the transmitter changes from HS- 0 to HS- 1.
If the last load bit is HS- 1, the transmitter changes from HS- 1 to HS- 0

Data Lanes from High Speed Mode to Low Power Mode Timing

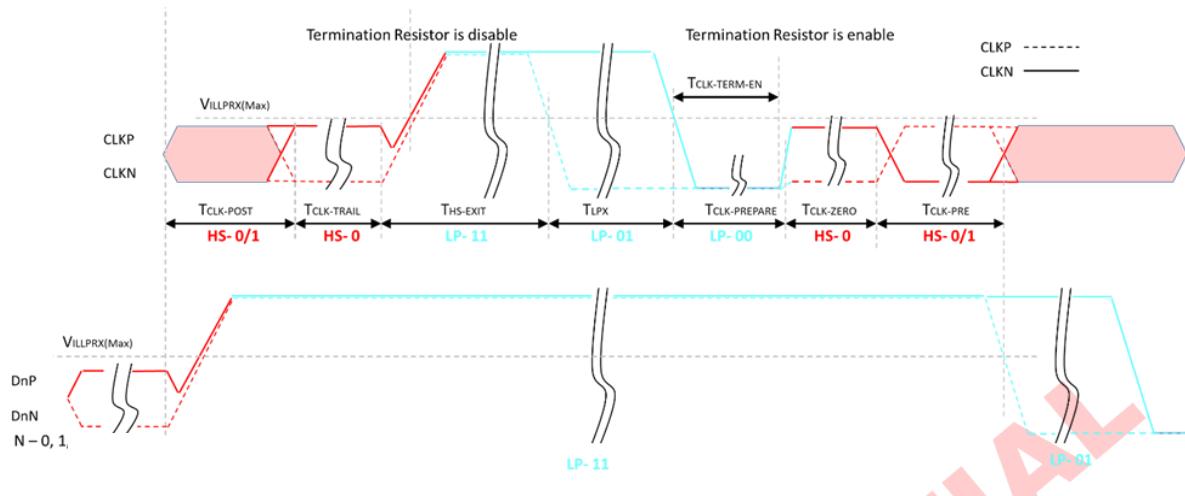

Data Lanes from High Speed Mode to Low Power Mode Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|--------|----------|---|---------------|-----|---------|------|-------|
| | | | MIN | TYP | MAX | | |
| DnP/N | THS-SKIP | Time-Out at Display Module to ignore transition period of EoT | 40 | | 55+4*UI | nS | 1 |
| DnP/N | THS-EXIT | Time to drive LP-11 after HS burst | 100 | | | nS | 1 |

Note 1: DnP/N, n=0, and 1.

CHIPONE

6.5.7 DSI Clock Burst – High speed mode to /from Low Power Mode

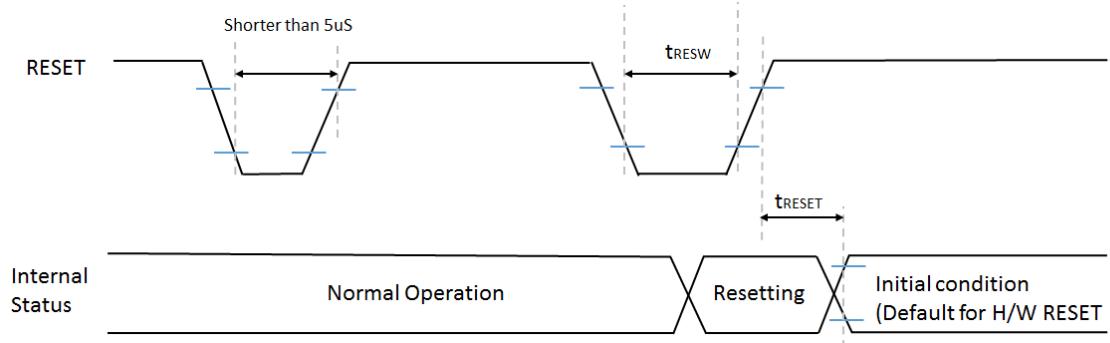

Clock Lane –High speed mode to / from Low Power Mode Timing

DSI Clock Burst – High speed mode to /from Low Power Mode Timing

| Signal | Symbol | Parameter | Specification | | | Unit | Notes |
|--------|------------------------|--|---------------|-----|-----|------|-------|
| | | | MIN | TYP | MAX | | |
| CKP/N | TCLK-POST | Time that the MCU shall continue sending HS clock after the last associated Data Lanes has transitioned to LP mode | 60+52*UI | | | nS | |
| CKP/N | TCLK-TRAIL | Time to drive HS differential state after last payload clock bit of a HS transmission burst | 60 | | | nS | |
| CKP/N | THS-EXIT | Time to drive LP-11 after HS burst | 100 | | | nS | |
| CKP/N | TCLK-PREPARE | Time to drive LP-00 to prepare for HS transmission | 38 | | 95 | nS | |
| CKP/N | TCLK-TERM-EN | Time-out at Clock Lane to enable HS termination | | | 38 | nS | |
| CKP/N | TCLK-PREPARE+TCLK-ZERO | Minimum lead HS-0 drive period before starting Clock | 300 | | | nS | |
| CKP/N | TCLK-PRE | Time that the HS clock shall be driven prior to any associated Data Lane beginning the transition from LP to HS mode | 8*UI | | | nS | |

6.6 Reset Input Timing

Reset Input Timing

Condition : $T_a = 25^\circ\text{C}$

Reset Input Timing

| Signal | Symbol | Parameter | Description | Specification | | | Unit | Notes |
|--------------|---------------|-----------------------|--|---------------|-----|-----|------|-------|
| | | | | MIN | TYP | MAX | | |
| RESET | tRESW | Reset "L" pulse width | | 10 | | | μS | 1 |
| | tRESET | Reset complete time | When reset applied during Sleep in mode | | | 5 | mS | 2 |
| | | | When reset applied during Sleep Out mode | | | 120 | mS | 5 |

Note 1: Spike due to an electrostatic discharge on **RESET** line does not cause irregular system reset according to the table below.

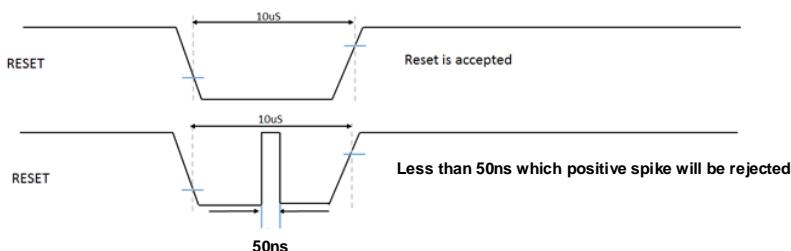

Reset Input Actions

| RESET Pulse | Action |
|----------------------|----------------|
| Short than 5μs | Reset Rejected |
| Long than 10μs | Reset |
| Between 5μs and 10μs | Reset Start |

Note 2: During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120ms, when Reset Starts in sleep out mode. The display remains the blank state in sleep in mode) and then return to Default condition for H/W RESET.

Note3: During Reset Complete Time, values in OTP memory will be latched to internal register during this period. This loading is done every time when there is H/W RESET complete time(**tRESET**) within 5ms after a rising edge of **RESET**.

Note4: Spike Rejection also applies during a valid reset pulse as shown below.

Note5: It is necessary to wait 5ms after releasing **RESET** before sending commands. Also Sleep Out command cannot be sent for 120msec.

7. Command

7.1 Command Table Switch Flow

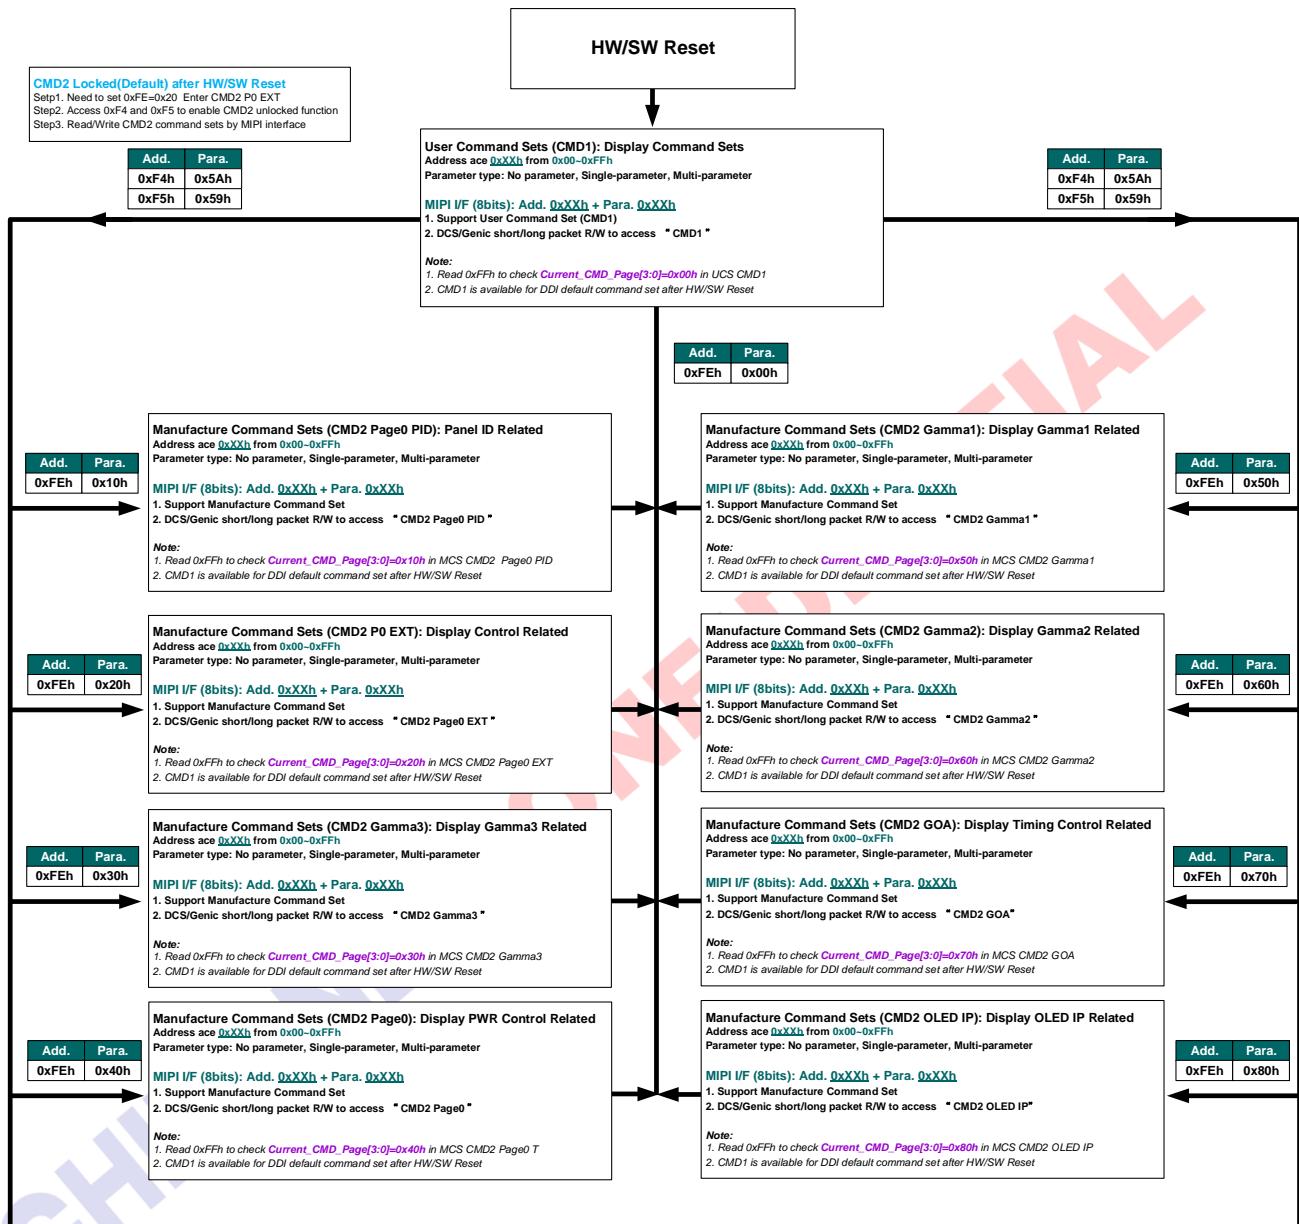

Figure shown Switching Flow for Accessing Registers in UCS / MCS by MIPI interface.

Note:

- After power on or HW/SW reset, the default page is in CMD1.
- After power on or HW/SW reset, CMD2 Register Pages are locked.

Step1. Need to set 0xFE=0x20 → Enter CMD2 P0 EXT

Step2. Access 0xF4 and 0xF5 to enable CMD2 pages unlocked function

Step3. Read/Write CMD2 page by MIPI interface

7.2 Pass Word Command Description in UCS (Command1)

7.2.1 PASSWD1

7.5.4 RDNUMED: Read Number of Errors on DS1 (05h)

| Command set | | RDNUMED | | | | | | | | |
|-------------|-----|---------|------|------|------|--------|------|------|------|---------------|
| Inst / Para | W/R | D[7] | D[6] | D[5] | D[4] | D[3] | D[2] | D[1] | D[0] | Default Value |
| RDNUMED | R | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 05h |
| Parameter 1 | | | | | | P[7:0] | | | | 00h |

NOTE: “-”Don’t care

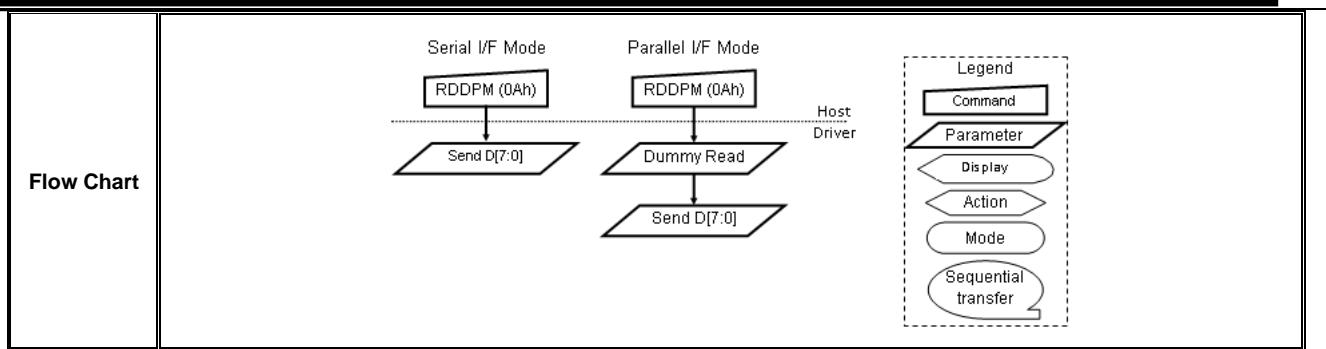

| Description | The first parameter is telling a number of the parity errors on DS1. The more detailed description of the bits is below. P[6..0] bits are telling a number of the parity errors. P[7] is set to “1” if there is overflow with P[6..0] bits. P[7..0] bits are set to “0”s (as well as RDDSM(0Eh)’s D0 are set “0” at the same time) after there is sent the first parameter information (= The read function is completed). See also section “Acknowledge with Error Report (AwER)” and command RDDSM 0Eh. | | | | | | | | | | | | |

| Parameter 2 | | N7 | N6 | N5 | N4 | N3 | N2 | N1 | N0 | 00h |

NOTE: “-”Don’t care

| Description | <p>This command turns on the display module's Tearing Effect output signal on the TE signal line when the display module reaches line N. The TE signal is not affected by changing MADCTL bit ML. The Tearing Effect Line On has one parameter, which describes the mode of the Tearing Effect Output Line mode. The Tearing Effect Output line consists of V-Blanking information only.</p>  <p>Note 1: STESL with N[15:0] = "0000h" is equivalent to TEON with M = "0" The Tearing Effect Output line shall be active low when the display module is in Sleep In mode.</p> <p>Note 2: This command takes effect on the frame following the current frame. Therefore, if the TE output is already on, the TE output shall continue to operate as programmed by the previous “TEON (35h)” or “STESL (44h) command” until the end of the frame.</p> | | | | | | | | | | | | |
|---|--|--------|---------------|--|-------|---|-------|---|-------|--|-----|----------|-----|

| H/W Reset | 00h | | | | | | | | | | | | | |
| Flow Chart | <p>The flowchart illustrates the communication between the Host and the Driver. The Host initiates the process by sending the command RDDISBV(52h) to the Driver. The Driver then responds by sending the parameter BV[7:0] back to the Host. A legend on the right side of the flowchart defines the symbols used in the diagram: a triangle for command, a rectangle for Parameter, a circle for Display, an arrow for Action, a diamond for Mode, and an oval for Sequential transfer.</p> | | | | | | | | | | | | | |

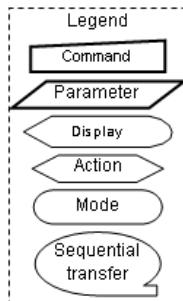

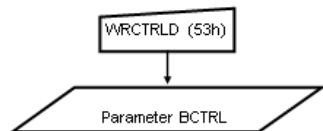

7.5.40 WRCTRLD: Write CTRL Display (53h)

| Command set | | WRCTRLD | | | | | | | | |
|-------------|-----|---------|------|-------|------|------|------|------|------|---------------|
| Inst / Para | W/R | D[7] | D[6] | D[5] | D[4] | D[3] | D[2] | D[1] | D[0] | Default Value |

| Parameter 1 | | - | - | BCTRL | - | DD | - | - | - | 28h |

NOTE: “-”Don’t care

| Description | This command is used to control display brightness. BCTRL: Brightness Control Block On/Off. The BCTRL bit is always used to switch brightness for display with dimming effect (according to DIM_EN bit). BCTRL =0, dBV[7:0] value disable. BCTRL =1,d BV[7:0] value enable. | | | | | | | | | | | | | |
|---|--|--|--------|---------------|--|-----|---|-----|---|-----|--|-----|----------|-----|
| | DD: Display Dimming Control On/Off. DD = 0, Display dimming is off. DD =1, Display dimming is on. The dimming function is adapted to the brightness registers for display when bit BCTRL is changed at DD ="1", e.g. BCTRL: 0_1 or 1_0. <i>Note: All read and write commands are valid, but there is no effect (except registers can be changed) when write commands are used.</i> | | | | | | | | | | | | | |

8.2 EXTERNAL COMPONENTS CONNECTION

The Following components are necessary connected on the module to make sure the CO5300 can provided high performance and reliability.

AVDD are generated by SWIRE if (BSTM=0)

| Pad Name | Connection | Typical Value |
|-------------|---|---------------|
| VCI | Connect to Capacitor (Max 6.3V) : VCI ----- ---- GND | 2.2uF |
| VDDI | Connect to Capacitor (Max 6.3V) : VDDI ----- ---- GND | 2.2uF |
| VREF | Connect to Capacitor (Max 6.3V) : VREF ----- ---- GND | 22nF |
| VDD | Connect to Capacitor (Max 6.3V) : VDD ----- ---- GND | 1.0uF |
| VREFP/VREFN | Connect to Capacitor (Max 6.3V) : VREFP/VREFN ----- ---- GND | 1.0uF |
| VGHR | Connect to Capacitor (Max 16V) : VGHR ----- ---- GND | 1.0uF |
| VGLR | Connect to Capacitor (Max 16V) : VGLR ----- ---- GND | 1.0uF |
| ELVDD | Connect to Capacitor (Max 10V) : ELVDD ----- ---- GND | 2.2uF |
| ELVSS | Connect to Capacitor (Max 10V) : ELVSS ----- ---- GND | 2.2uF |
| C11P/C11N | Connect to Capacitor (Max 6.3V) : C11P----- ---- C11N | 1.0uF |
| C12P/C12N | Connect to Capacitor (Max 6.3V) : C12P----- ---- C12N | 1.0uF |
| AVDD | Connect to Capacitor (Max 10V) : AVDD ----- ---- GND | 2.2uF |
| C41P/C41N | Connect to Capacitor (Max 6.3V) : C41P ----- ---- C41N | 1.0uF |
| C42P/C42N | Connect to Capacitor (Max 6.3V) : C42P ----- ---- C42N | 1.0uF |
| VCL | Connect to Capacitor (Max 10V) : VCL ----- ---- GND | 2.2uF |
| C21P/C21N | Connect to Capacitor (Max 16V) : C21P ----- ---- C21N | 1.0uF |
| VGH | Connect to Capacitor (Max 25V) : VGH ----- ---- GND | 2.2uF |
| C31P/C31N | Connect to Capacitor (Max 16V) : C31P ----- ---- C31N | 1.0uF |
| VGL | Connect to Capacitor (Max 25V) : VGL ----- ---- GND | 2.2uF |
| VGL-GND | Connect to Schottky diode: VGL -----► ----GND | D4(RB520G-30) |

9. Important Notice

Chipone Technology (Beijing) Co., Ltd. (Chipone) reserves the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

Chipone warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with Chipone's standard warranty. Testing and other quality control techniques are utilized to the extent Chipone deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). CHIPONE SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF CHIPONE PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

Chipone assumes no liability for applications assistance or customer product design. Chipone does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of Chipone covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. Chipone's publication of information regarding any third party's products or services does not constitute Chipone's approval, warranty or endorsement thereof.
