

Silicon N-Channel Power MOSFET

CS4N70 A4HD

General Description:

CS4N70 A4HD, the silicon N-channel Enhanced VDMOSFETs, is obtained by the self-aligned planar Technology which reduce the conduction loss, improve switching performance and enhance the avalanche energy. The transistor can be used in various power switching circuit for system miniaturization and higher efficiency. The package form is TO-252, which accords with the RoHS standard.

Features:

- | Fast Switching
- | ESD Improved Capability
- | Low Gate Charge (Typical Data: 15nC)
- | Low Reverse transfer capacitances(Typical: 9pF)
- | 100% Single Pulse avalanche energy Test

Applications:

Power switch circuit of adaptor and charger.

V _{GSO}	Gate-source breakdown voltage	I _{GS} =±1mA(Open Drain)	30			V
The built-in back-to-back Zener diodes have specifically been designed to enhance not only the device's ESD capability, but also to make them safely absorb possible voltage transients that may occasionally be applied from gate to source. In this respect the Zener voltage is appropriate to achieve an efficient and cost-effective intervention to protect the device's integrity. These integrated Zener diodes thus avoid the usage of external components.

Warnings

1. Exceeding the maximum ratings of the device in performance may cause damage to the device, even the permanent failure, which may affect the dependability of the machine. It is suggested to be used under 80 percent of the maximum ratings of the device.
2. When installing the heatsink, please pay attention to the torsional moment and the smoothness of the heatsink.
3. VDMOSFETs is the device which is sensitive to the static electricity, it is necessary to protect the device from being damaged by the static electricity when using it.
